

Strict Typing & Static Analysis

Rob Allen

*Use Types to Help Focus on What You're Doing,
Not How You're Doing It*

Anthony Ferrara, 2016

PHP Types

boolean

float

array

callable

resource

integer

string

object

iterable

NULL

PHP is a *dynamically typed*
language

Type Juggling

PHP will automatically convert types when it can.

```
var_dump("Two + three = " . 5);
```

Type Juggling

PHP will automatically convert types when it can.

```
var_dump("Two + three = " . 5);  
// string(15) "Two + three = 5"
```

Type Juggling

PHP will automatically convert types when it can.

```
var_dump("Two + three = " . 5);  
// string(15) "Two + three = 5"
```

```
var_dump("10" + 5);
```

Type Juggling

PHP will automatically convert types when it can.

```
var_dump("Two + three = " . 5);  
// string(15) "Two + three = 5"
```

```
var_dump("10" + 5);  
// int(15)
```

But...

```
$result = 10 + "10,000";  
var_dump($result);
```

But...

```
$result = 10 + "10,000";  
var_dump($result);
```

```
// int(20)
```

But...

```
$result = "false";  
if ($result) {  
    echo "TRUE";  
} else {  
    echo "FALSE";  
}
```

But...

```
$result = "false";  
if ($result) {  
    echo "TRUE";  
} else {  
    echo "FALSE";  
}
```

```
// TRUE
```

You can't trust a computer!

Test all the things

Validate your inputs

```
function foo($i, $b) {  
    if (! is_int($i)) {  
        throw new Exception('$i must be an integer');  
    }  
    if (! is_bool($b)) {  
        throw new Exception('$b must be a boolean');  
    }  
    // ...  
}
```

& write tests for the new code-paths

A type system solves this
class of errors

If we filter input by a type — you can think of it as a subcategory of all available input — many of the tests become obsolete.

@brendt_gd

Function Type Declarations

```
function foo(int $i, bool $b) : string {  
    // ...  
}
```

- `$i` is always an integer
- `$b` is always a boolean
- `foo( )` will always return a string

This function is much easier
to reason about

Coercion of Typed Declarations

```
function foo(int $i, bool $b) : string {  
    // ...  
}
```

```
foo("1", 1);
```

```
// $i = int(1)  
// $b = bool(true)
```

Strictly Typed Declarations

```
declare(strict_types=1);
```

```
foo("1", 1);
```

Fatal error: Uncaught TypeError: Argument 1 passed to foo() must be of the type int, string given

This reduces cognitive load

Typed Properties in PHP 7.4!

We can now add types to class properties

```
class Person
{
    public int $age;
}
```

Initialisation of Typed Properties

```
$liz = new Person();  
var_dump($liz->age);
```

Initialisation of Typed Properties

```
$liz = new Person();  
var_dump($liz->age);
```

Fatal error: Uncaught Error: Typed property Person::\$age must not be accessed before initialization

Coercion of Typed Properties

```
class Person { /* ... */}  
  
$liz = new Person();  
$liz->age = "93"; // int(93)
```

Strictly Typed Properties

```
declare(strict_types=1);
```

```
$liz = new Person();  
$liz->age = "93";
```

Fatal error: Uncaught TypeError:
Typed property Person::\$age must be int, string used

But that's all at runtime...

Static Analysis checks our
code before we run it

Static Analysis

Static code analysers simply reads your code and points out errors

They ensure:

- no syntax errors
- classes, methods, functions constants, variables exist
- no arguments or variables unused
- DocBlocks make sense
- data passed to methods are the correct type

Static Analysers

Interactive:

- IDE

PhpStorm

```
36 public function fetchAllForGroupKey(int $key): array
37 {
38     $cacheKey = $key;
39     if (!isset($this->choicesByGroupKey[$cacheKey])) {
40         $choices = $this->choiceMapper->fetchAllForGroupKey($key);
41         $this->choicesByGroupKey
42     }
43
44     return $this->choicesByGroupKey[$cacheKey];
45 }
```

Expected parameter of type 'string', 'int' provided

Cast \$key to string

More actions...

Static Analysers

Interactive:

- IDE

Command line:

- Phan
- PHPStan
- Psalm

Phan

- Developed by Rasmus Lerdorf & Etsy
- Stable
- Parses entire code base and then analyses
- Requires php-ast extension
- Doesn't parse `/** @var Foo $foo */; use assert( ) instead`

Phan

1. `composer require --dev "phan/phan"`
2. `vendor/bin/phan --init --init-level=1`
3. `vendor/bin/phan --memory-limit 2G`

Phan output

```

portal (bash)
rob@swiftsure portal $ vendor/bin/phan --memory-limit 2G

PHPStan

- Developed by Ondřej Mirtes
- Fast
- Can analyse subset of code base
- Autoloads classes
- Support for framework specific magic methods

PHPStan

1. `composer require --dev "phpstan/phpstan"`
2. `vendor/bin/phpstan analyse app lib --level=max`

PHPStan output

A screenshot of a terminal window titled 'portal' showing the output of a PHPStan analysis. The terminal has a dark background with light green text. At the top, a progress bar shows '561/561' and '100%'. Below this, the output is organized into sections separated by dashed lines. Each section starts with 'Line' followed by the filename. The first section is for 'app/bootstrap.php' and shows an error on line 22. The second section is for 'app/config/global.php' and shows three errors on lines 96, 190, and 232. The third section is for 'app/config/online-demo.php' and shows two errors on lines 7 and 8.

```
portal (bash) +
rob@swiftsure portal $ php -d memory_limit=3G vendor/bin/phpstan analyse app lib --level=max
561/561 [ ] 100%

-----
Line  app/bootstrap.php
-----
22  Parameter #1 $str of function trim expects string, string|false given.
-----

-----
Line  app/config/global.php
-----
96  Constant APPLICATION_PATH not found.
190 Constant APPLICATION_PATH not found.
232 Constant JOB_NAME not found.
-----

-----

8 Constant APPLICATION_ENV not found.
```

85 Else branch is unreachable because ternary operator condition is always true.

Psalm

- Developed by Vimeo
- Comprehensive
- Can analyse subset of code base
- Autoloads classes
- Support custom PHPDoc tags (e.g. `@psalm-param`)

Psalm

1. `composer require --dev "vimeo/psalm"`
2. `vendor/bin/psalm --init`
3. `vendor/bin/psalm`

Psalm output

```
portal (bash) +
rob@swiftsure portal $ ./vendor/bin/psalm

ERROR: MixedAssignment - app/bootstrap.php:17:5 - Cannot assign $siteId to a mixed type
$siteId = $_ENV['SITE_ID'] ?? $_SERVER['SITE_ID'] ?? $_SERVER['CUSTOMCONNSTR_SITE_ID']
```

Psalm output

```
portal (bash)
rob@swiftsure portal $ ./vendor/bin/psalm
Scanning files...
Analyzing files.

ERROR: PossiblyNullReference -
AdminChoiceController.php:41:33 - Cannot
call method groupName on possibly null
value

720 / 840 (86%)
780 / 840 (93%)
840 / 840 (100%)

ERROR: MixedAssignment - app/bootstrap.php:17:5 - Cannot assign $siteId to a mixed type
$siteId = $_ENV['SITE_ID'] ?? $_SERVER['SITE_ID'] ?? $_SERVER['CUSTOMCONNSTR_SITE_ID']
```

Observations

- All are good at finding type issues
- All three also found different issues
 - Phan found unused `use` statements
 - PHPStan found logic errors
 - Psalm is more type-picky, especially with `mixed`

What Problems Do Static Analysers Find?

Report 1

```
class Acl extends BaseAcl
{
    protected $siteKey = '';
    protected $settings;

    public function __construct(array $settings) {
        $this->settings = $settings;
    }
}
```

Report 1

```
class Acl extends BaseAcl
{
    protected $siteKey = '';
    protected $settings;

    public function __construct(array $settings) {
        $this->settings = $settings;
    }
}
```

INFO: MissingPropertyType – Property Acl::\$siteKey
does not have a declared type – consider string

Report 1: Fix (PHP 7.4)

```
class Acl extends BaseAcl
{
    protected string $siteKey = '';
    protected $settings;
```

Add property's type

Report 1: Fix (PHP 7.3)

```
class Acl extends BaseAcl
{
    /** @var string */
    protected $siteKey = '';
    protected $settings;
```

Use a docblock to declare property's type

Report 2

```
public function setSiteKey($siteKey)
{
    $this->siteKey = $siteKey;
    return $this;
}
```

Report 2

```
public function setSiteKey($siteKey)
{
    $this->siteKey = $siteKey;
    return $this;
}
```

INFO: MissingParamType – Parameter \$siteKey has no provided type

INFO: MissingReturnType – Method setSiteKey does not have a return type, expecting Acl

Report 2: Fix

```
public function setSiteKey(string $siteKey)
{
    $this->siteKey = $siteKey;
    return $this;
}
```

Add parameter's type

Report 2: Fix

```
public function setSiteKey(string $siteKey): Acl  
{  
    $this->siteKey = $siteKey;  
    return $this;  
}
```

Add parameter's type & return type

An bona fide potential bug!

```
public function populate(): void
{
    $siteKey = $this->getSiteKey() ?: 1;
    $routes = $this->router->slugRoutes($siteKey);
    foreach ($routes as $route) {
```

An bona fide potential bug!

```
public function populate(): void
{
    $siteKey = $this->getSiteKey() ?: 1;
    $routes = $this->router->slugRoutes($siteKey);
    foreach ($routes as $route) {
```

ERROR: InvalidScalarArgument Argument 1 of slugRoutes expects string, int(1)|non-empty-string provided

Fix for this potential bug

```
public function populate(): void
{
    $siteKey = $this->getSiteKey() ?: SiteKey::DEFAULT;
    $routes = $this->router->slugRoutes($siteKey);
    foreach ($routes as $route) {
```

Change the default to the new default

Another potential bug

```
public function home(Request $request)
{
    $name = $request->get('key_name');
    $group = $this->cgService->loadByKey($name);
    ...
}
```

Another potential bug

```
public function home(Request $request)
{
    $name = $request->get('key_name');
    $group = $this->cgService->loadByKey($name);
    ...
}
```

ERROR: InvalidArgument – Argument 1 of
ChoiceGroupService::loadByKey expects string,
array<array-key, mixed>|mixed|null provided

Query parameters

```
$name = $request->get( 'key_name' )
```

example.com/home?key_name=FOO

```
$name = 'FOO'
```

Query parameters

```
$name = $request->get( 'key_name' )
```

```
example.com/home?key_name=FOO
```

```
    $name = 'FOO'
```

```
example.com/home
```

```
    $name = null
```

Query parameters

```
$name = $request->get( 'key_name' )
```

```
example.com/home?key_name=FOO
```

```
$name = 'FOO'
```

```
example.com/home
```

```
$name = null
```

```
example.com/home?key_name[]=FOO&key_name[]=BAR
```

```
$name = [ 'FOO', 'BAR' ]
```

Fix for this potential bug

```
public function home(Request $request)
{
    $name = $request->get('key_name');
    if (!is_string($name)) {
        throw new InvalidInputException('key_name');
    }
    $group = $this->cgService->loadByKey($name);
    ...
}
```

Validate input & error when invalid

Collections

```
class ChoiceService
{
    public function fetchChoices(): array { ... }
    ...
}
```

usage:

```
foreach ($service->fetchChoices() as $choice) { ... }
```

Collections

```
/**  
 * @return Choice[]  
 */  
public function fetchChoices(): array { ... }
```

Declare type of array returned using a docblock

Collections

```
/**  
 * @return Choice[]  
 */  
public function fetchChoices(): array { ... }
```

ERROR: InvalidReturnStatement – The type
'array{0: Choice|null}' does not match the declared
return type 'array<array-key, Choice>' for
ChoiceService::fetchChoices

False positive?

```
// loadByKey() returns: ?Choice
$choice = $choiceService->loadByKey($keyName);
if (!$choice) {
    $this->redirectToHome(); // throws an Exception
}
$data = $choice->getArrayCopy();
return $this->format($data);
```

False positive?

```
// loadByKey() returns: ?Choice
$choice = $choiceService->loadByKey($keyName);
if (!$choice) {
    $this->redirectToHome(); // throws an Exception
}
$data = $choice->getArrayCopy();
return $this->format($data);
```

Cannot call method getArrayCopy on possibly null value

False positive?: Fix

```
/**  
 * @psalm-return never-return  
 */  
public function redirectToHome(): void  
{  
    // ...  
}
```

Guarantees that the function exits or throws an exception

Psalm annotations

`@psalm-var`, `@psalm-param` & `@psalm-return`:

Psalm versions for types not understood by phpDocumentor
`never-return` adds an implicit `exit` at end of function

Psalm annotations

`@psalm-var`, `@psalm-param` & `@psalm-return`:

Psalm versions for types not understood by phpDocumentor
`never-return` adds an implicit `exit` at end of function

`@psalm-seal-properties`:

Prevent `__set`/`__get` not declared with `@property`
