Cap height

Alphabetic baseline

Leading-trim – the future

The problem with text boxes today

In a standard text box, there's almost always extra space above and below the actual text. Because of this, when you use a text box to measure and implement spacing, it ends up larger than you intended. The bigger the line height, the bigger the problem. The example below shows distances between text boxes set to 32px. As you can see, all the vertical spacing is visually much bigger than 32px, even though you set them all to the same value.

Glossary of Terms and Jargon

Getting started with a history, skill guide and how-to of web standards.

Introduction

The “web platform” is comprised of a collection of standardized **application programming interfaces (APIs)** that programmers use to make web pages and web applications. This includes technologies, like HTML, CSS and JavaScript. In addition to including a full implementation of the JavaScript programming language that web browsers share with **Node.js**, web browsers expose their own standardized **APIs** specifically made for interacting with web pages.

The web platform is powerful and expressive, but it’s also a little broken in parts. That’s where the other part of the web platform comes in. The term “web platform” *also* describes the people and practices that are meant to include everyone in improving the standard programming interfaces. The web can only work if it’s built with an understanding of all its constituents—the whole world! This

[css-grid] Ability to target items in nth-row of autofilled, implicit grid #1943

Edit

New issue

Open

rachelandrew opened this issue on 6 Nov 2017 · 14 comments

rachelandrew commented on 6 Nov 2017

Member + 😊 ...

I've had various people ask me the same question as raised here: [rachelandrew/cssgrid-ama#115](#)

The use case is as described in that issue. If the author creates the following grid:

```
nav {
  display: grid;
  grid-template-columns: repeat(auto-fill, minmax(150px, 1fr));
}
```

They then want to style items on the second (or nth) row differently to the first, they don't have a way to target it. I've mocked it up using MQs. <https://codepen.io/rachelandrew/pen/yPJKeo?editors=1100>

It's really a selectors issue, would the table pseudo-class selectors (<https://drafts.csswg.org/selectors-4/#table-pseudos>) work on grid items, or is this another instance of needing to be able to target a row or column of the grid, with the added complication of wanting to target the children of that row or column?

At the moment to do so, they need to go back to taking more control over the grid, rather than using auto-fill, so that they know where each item sits and can use nth-child on the items, or use media queries which makes for less flexible components.

Issue 618969: [css-grid] Implement subgrid support

Reported by r...@igalia.com on Fri, Jun 10, 2016, 12:24 PM GMT+2

Project Member

 Code ⋮

There's a new reduced subgrid proposal that we could try to implement at some point.

The spec section: <https://drafts.csswg.org/css-grid/#subgrids>

Just reporting the bug to keep track of it and use it as meta-bug during the implementation.

This issue has been Available for over a year. If it's no longer important or seems unlikely to be fixed, please consider closing it out. If it is important, please re-triage the issue.

Sorry for the inconvenience if the bug really should have been left as Available. If you change it back, also remove the "Hotlist-Recharge-Cold" label.

For more details visit <https://www.chromium.org/issue-tracking/autotriage> - Your friendly Sheriffbot

⋮

It's just simply delayed. Subgrids were moved to Level 2 of the specs, so they are not a priority at all ATM. But it'll be eventually implemented.

[Comment 5](#) by sheriffbot@chromium.org on Mon, Jun 25, 2018, 6:04 PM GMT+2

This issue has been Available for over a year. If it's no longer important or seems unlikely to be fixed, please consider closing it out. If it is important, please re-triage the issue.

Sorry for the inconvenience if the bug really should have been left as Available.

Test and offer feedback on features behind flags.

This is the **best time** to make changes to a spec.

Incomplete List of Mistakes in the Design of CSS

That should be corrected if anyone invents a time machine. :P

- `white-space: nowrap` should be `white-space: no-wrap`
 - and line wrapping behavior should not have been added to `white-space`
- `vertical-align` should not apply to table cells. Instead the CSS3 alignment properties should exist in Level 1.
- `vertical-align: middle` should be `text-middle` or `x-middle` because it's not really in the middle, and such a name would better describes what it does.
- Percentage heights should be calculated against `fill-available` rather than being undefined in auto situations.
- Table layout should be sane.
- Box-sizing should be `border-box` by default.
- `background-size` with one value should duplicate its value, not default the second one to `auto`. Ditto `translate()`.
- `background-position` and `border-spacing` (all 2-axis properties) should take `*vertical*` first, to match with the 4-direction properties like `margin`.
- The 4-value shorthands like `margin` should go counter-clockwise (so that the inline-start value is before the block-start value).
- `z-index` should be called `z-order` or `depth` and should Just Work on all elements (like it does on flex items).
- `word-wrap/overflow-wrap` should not exist. Instead, `overflow-wrap` should be a keyword on `'white-space'`, like `nowrap` (`no-wrap`).
- The top and bottom margins of a single box should never have been allowed to collapse together automatically as this is the **root of all margin-collapsing evil**.
- Partial collapsing of margins instead of weird rules to handle min/max-heights?
- Tables (like other non-blocks, e.g. flex containers) should form pseudo-stacking contexts.
- The `currentcolor` keyword should have a dash, `current-color`. Likewise all other color multi-word keyword names.
- There should have been a predictable color naming system instead of arbitrary X11 names.
- `border-radius` should have been `corner-radius`.
- Absolutely-positioned replaced elements should stretch when opposite offset properties (e.g. `left+right`) are set, instead of being start-aligned.
- The `hyphens` property should be called `hyphenate`. (It's called `hyphens` because the XSL:FO people objected to `hyphenate`.)
- `rgba()` and `hsla()` should not exist, `rgb()` and `hsl()` should have gotten an optional fourth parameter instead (and the alpha value should have used the same format as R, G, and B or S and L).

web-platform-tests documentation

The web-platform-tests project is a W3C-coordinated attempt to build a cross-browser test suite for [the Web-platform stack](#). Writing tests in a way that allows them to be run in all browsers gives browser projects confidence that they are shipping software which is compatible with other implementations, and that later implementations will be compatible with their implementations. This in turn gives Web authors/developers confidence that they can actually rely on the Web platform to deliver on the promise of working across browsers and devices without needing extra layers of abstraction to paper over the gaps left by specification editors and implementors.

The most important sources of information and activity are:

- github.com/web-platform-tests/wpt: the canonical location of the project's source code revision history and the discussion forum for changes to the code
- web-platform-tests.org: the documentation website; details how to set up the project, how to write tests, how to give and receive peer review, how to serve as an administrator, and more
- web-platform-tests.live: a public deployment of the test suite, allowing anyone to run the tests by visiting from an Internet-enabled browser of their choice
- wpt.fyi: an archive of test results collected from an array of web browsers on a regular basis
- [Real-time chat room](#): the [IRC](#) chat room named `#testing` on irc.w3.org; includes participants located around the world, but busiest during the European working day; [all discussion is archived here](#)
- [Mailing list](#): a public and low-traffic discussion list

If you'd like clarification about anything, don't hesitate to ask in the chat room or on the mailing list.

Watch a Talk

If you prefer watching a video, here is a talk introducing web-platform-tests:

Many people who work on
CSS started by **writing tests.**

Comment on spec issues, raise new
issues, contribute examples, raise
browser bugs, write tests.

Thank you!
