# Visibility of System Status

The system should always keep users informed about what is going on, through appropriate feedback within reasonable time.

# Why measure DOMContentLoaded?

# Critical Rendering Path

page.html

main.css

other.css

main.js

other.js

# Perceived Performance

Perceived performance is a measure of how quick a user *thinks* your site is, and that's often more important than its true speed.

- Matt West

# Critical CSS

61 / 100 Speed

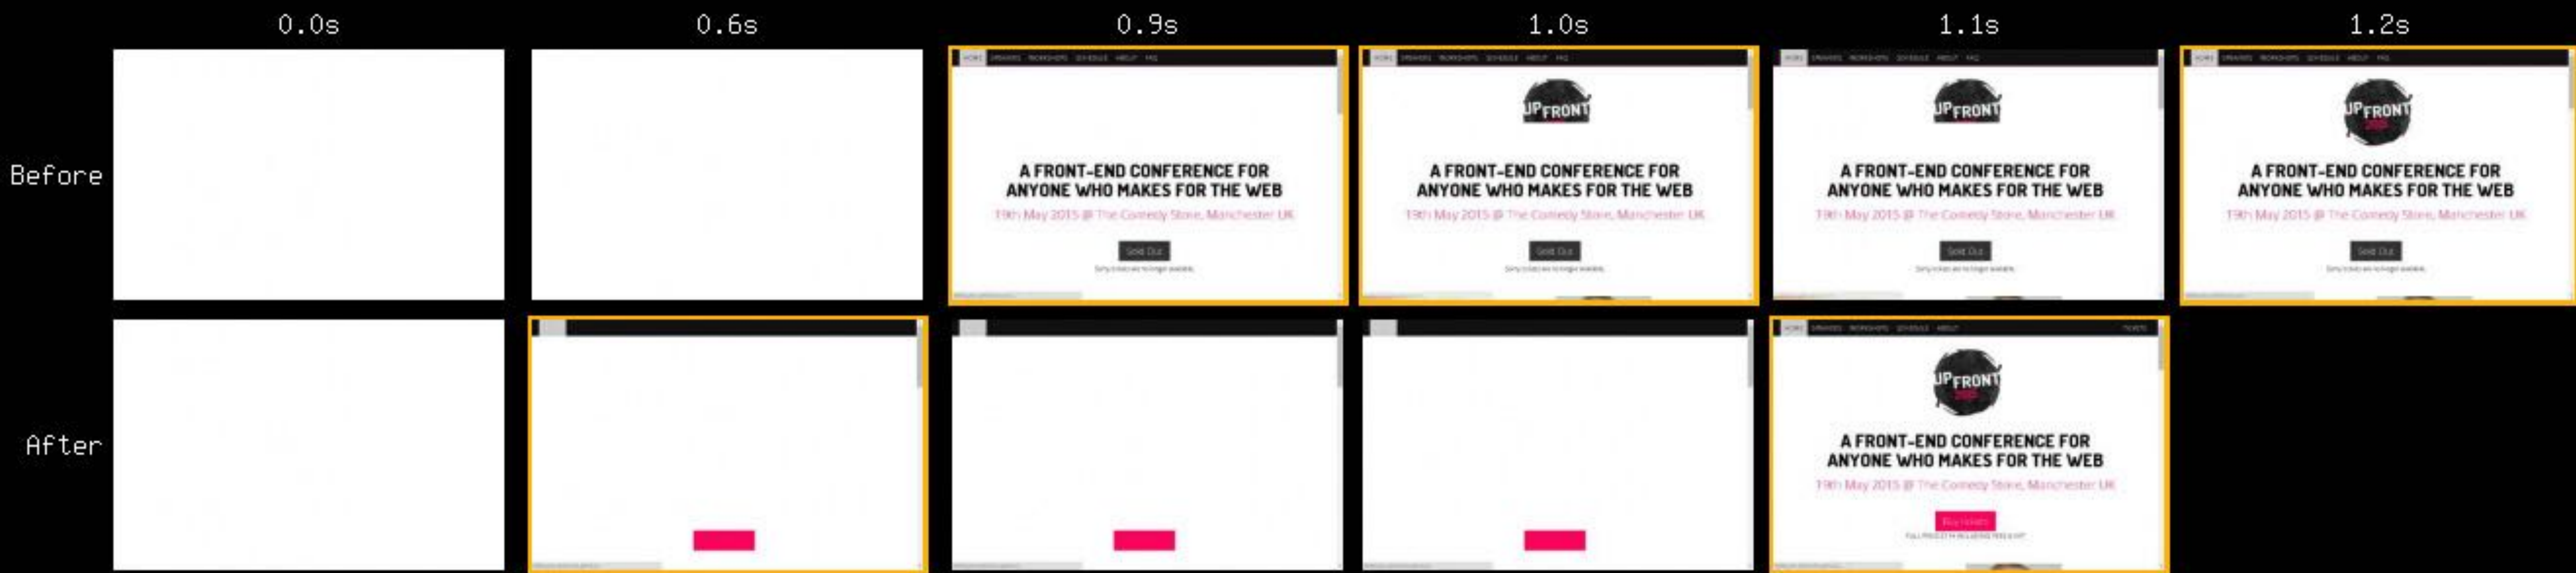

**!** Should Fix:

Eliminate render-blocking JavaScript and CSS in above-the-fold content

Your page has 5 blocking script resources and 6 blocking CSS resources. This causes a delay in rendering your page.

None of the above-the-fold content on your page could be rendered without waiting for the following resources to load. Try to defer or asynchronously load blocking resources, or inline the critical portions of those resources directly in the HTML.

# Skeleton Screens

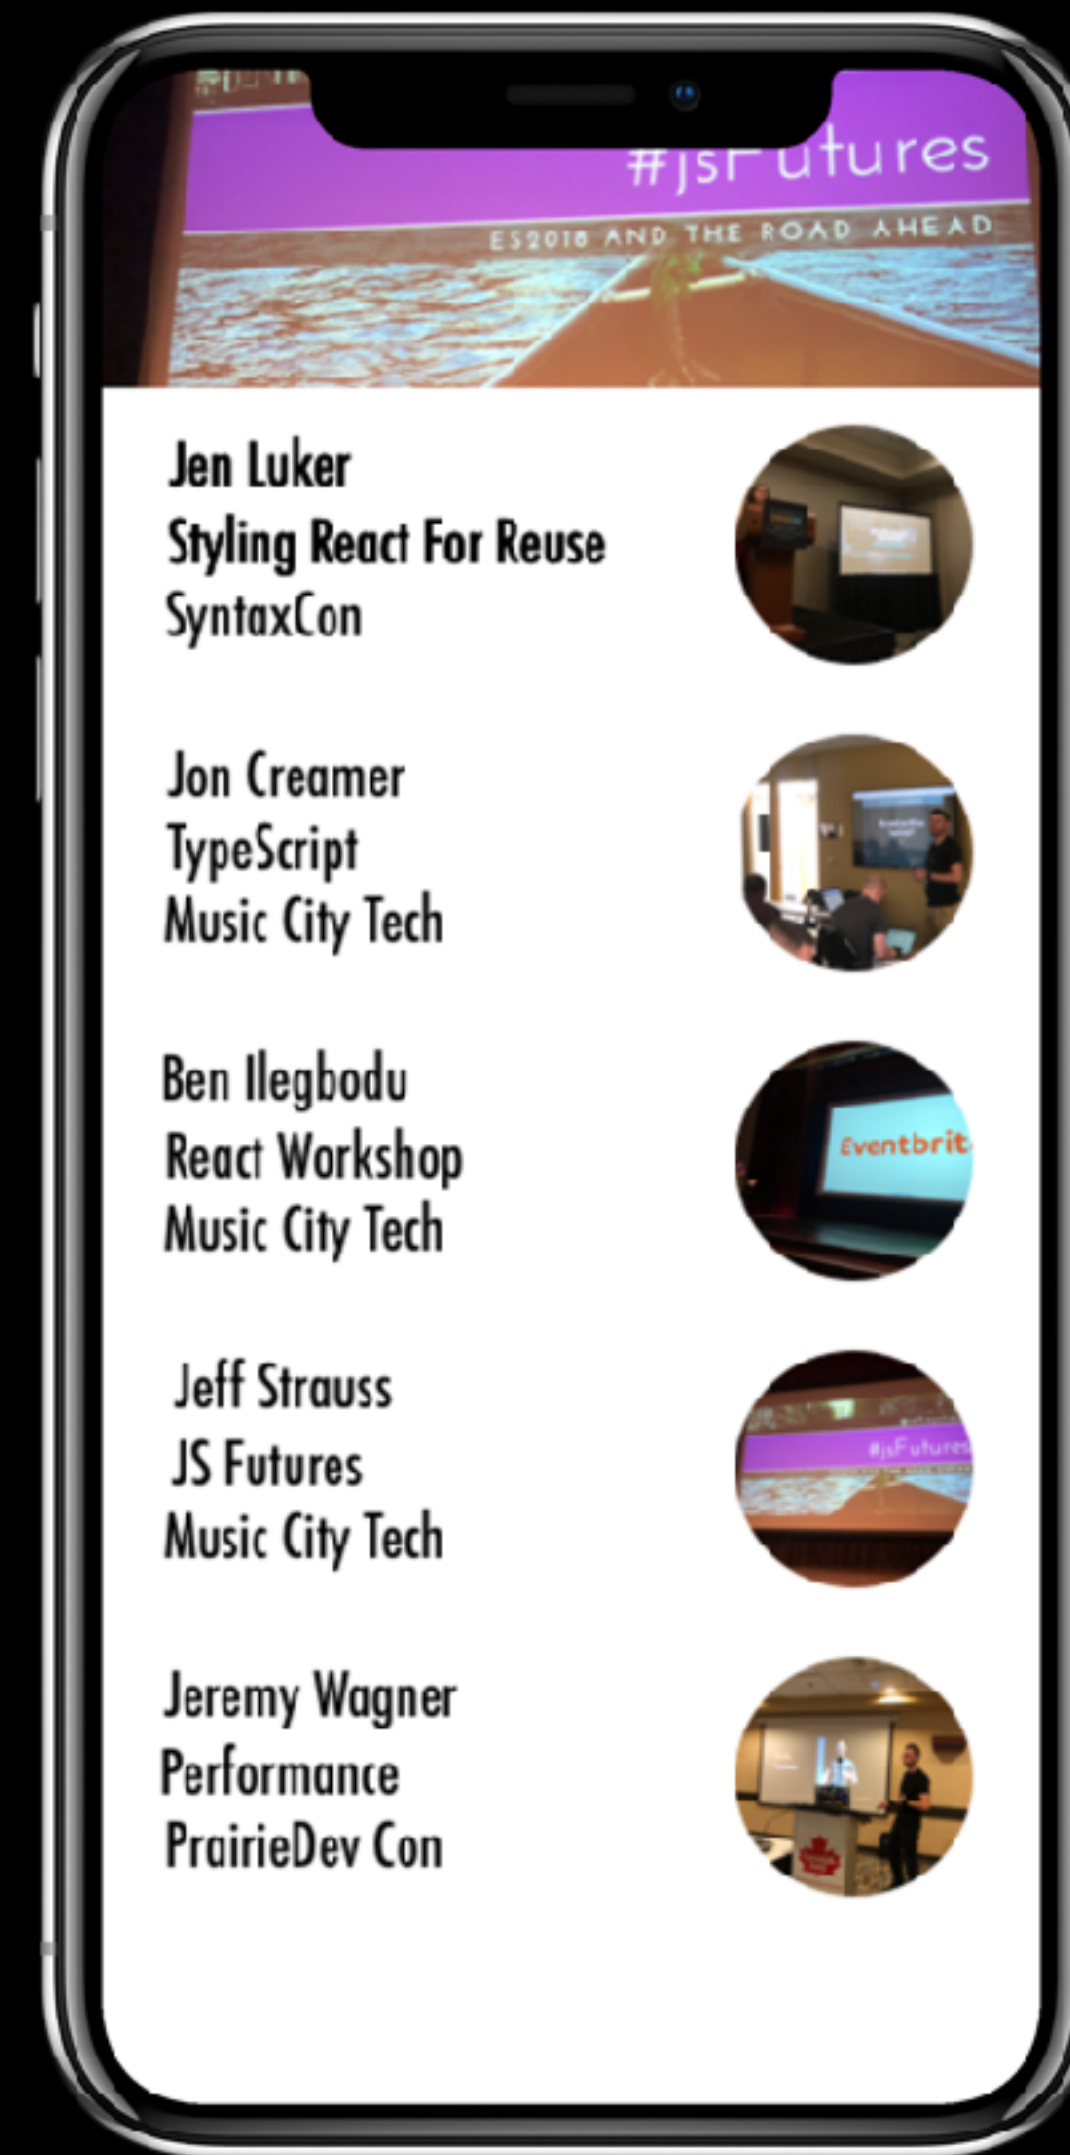

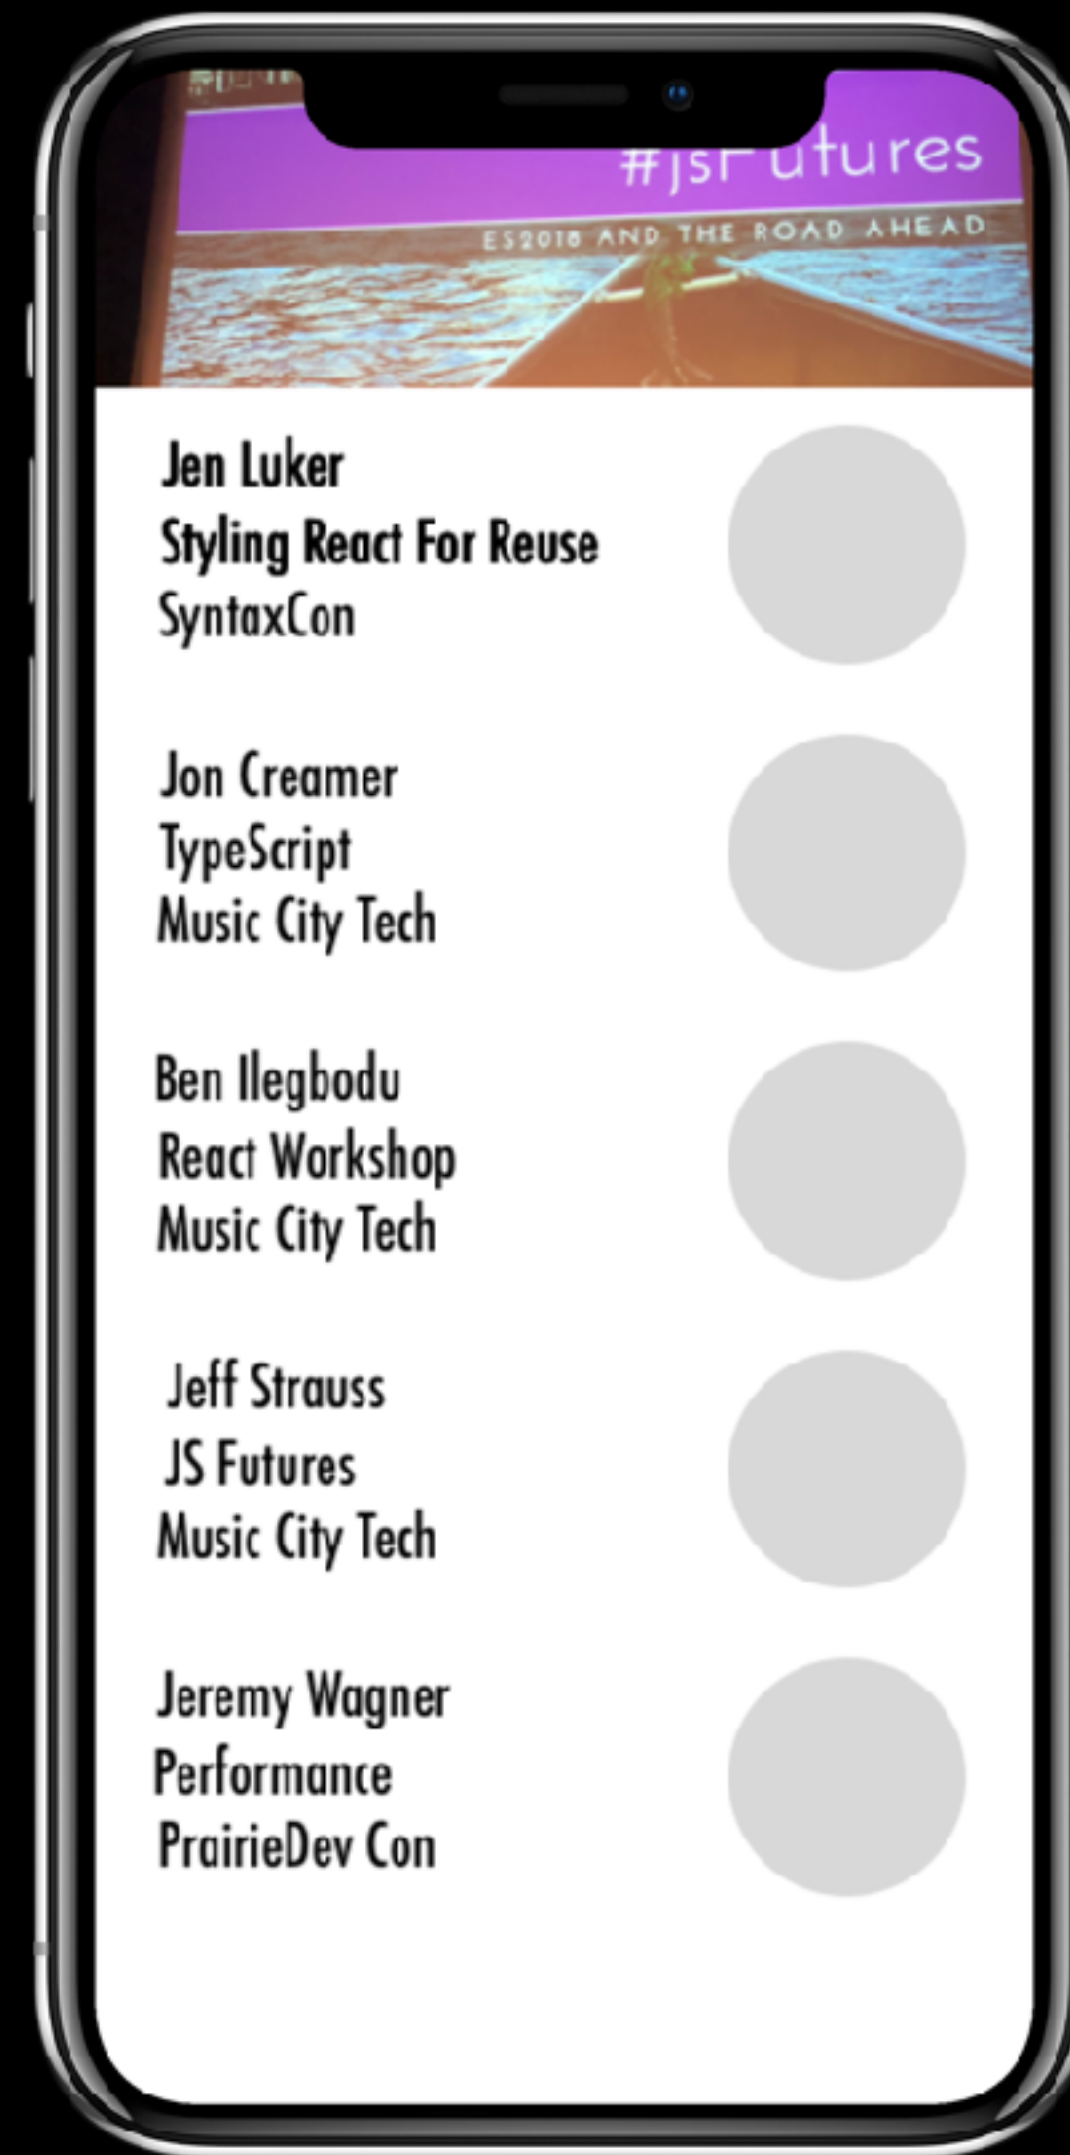

"A skeleton screen is essentially a blank version of a page into which information is **gradually** loaded."

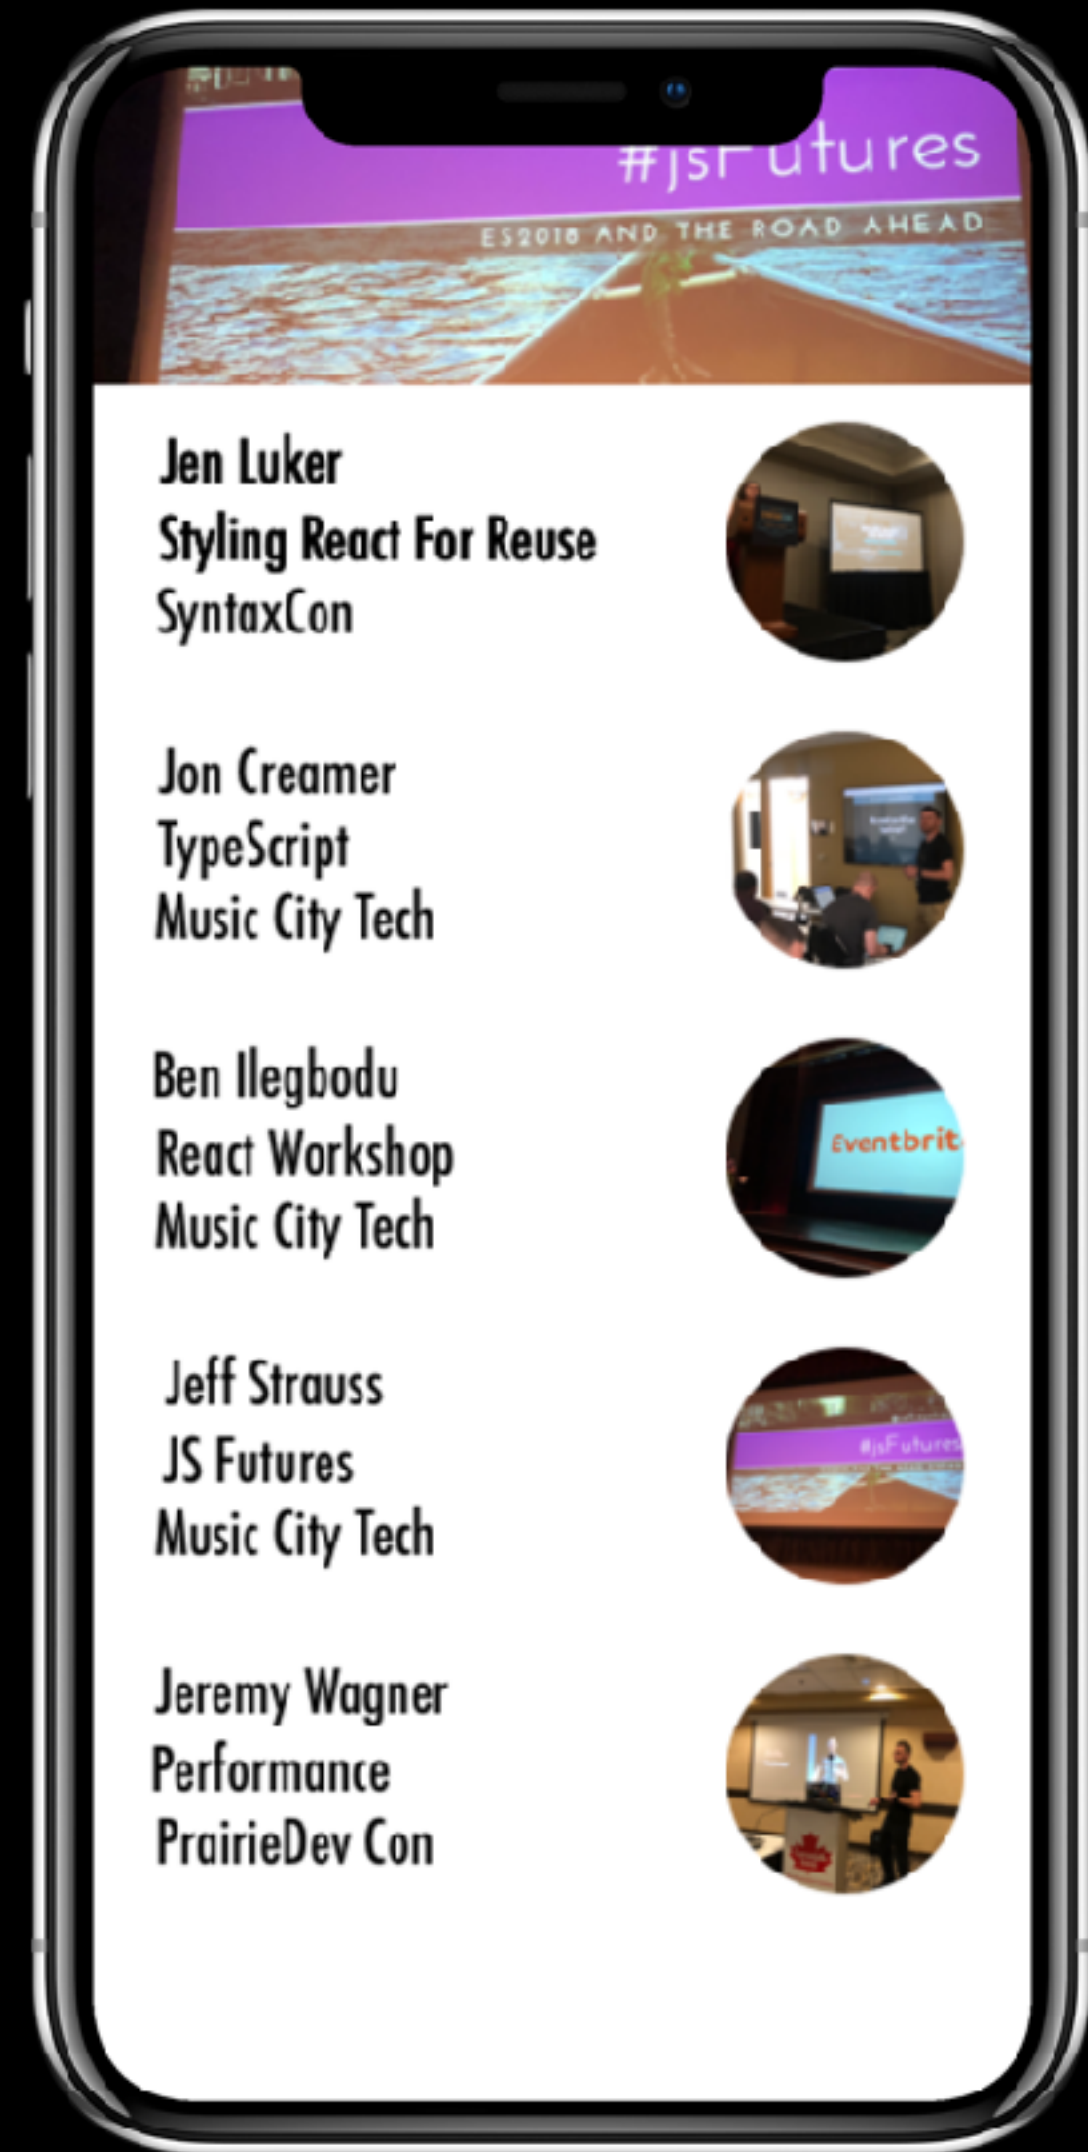

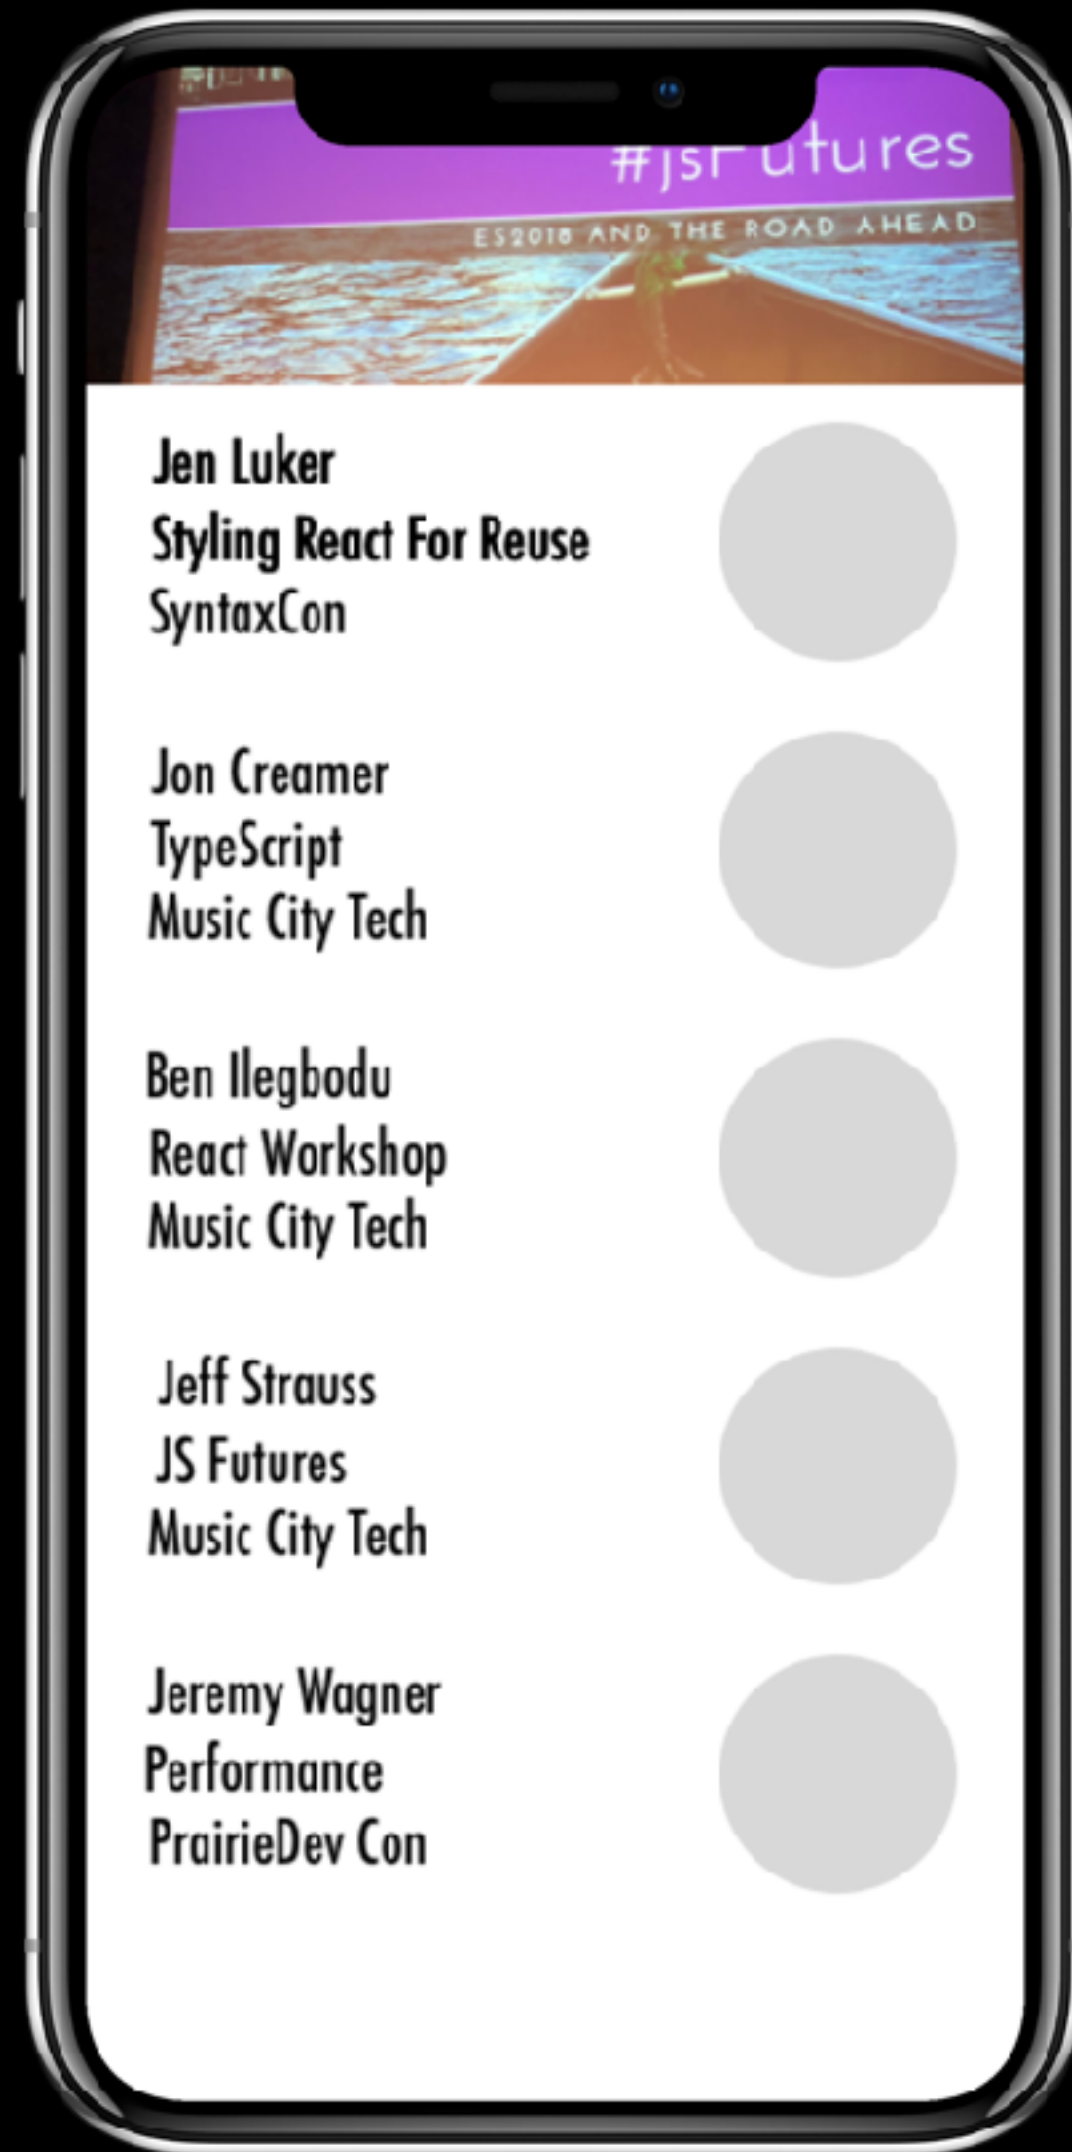

- Luke Wroblewski

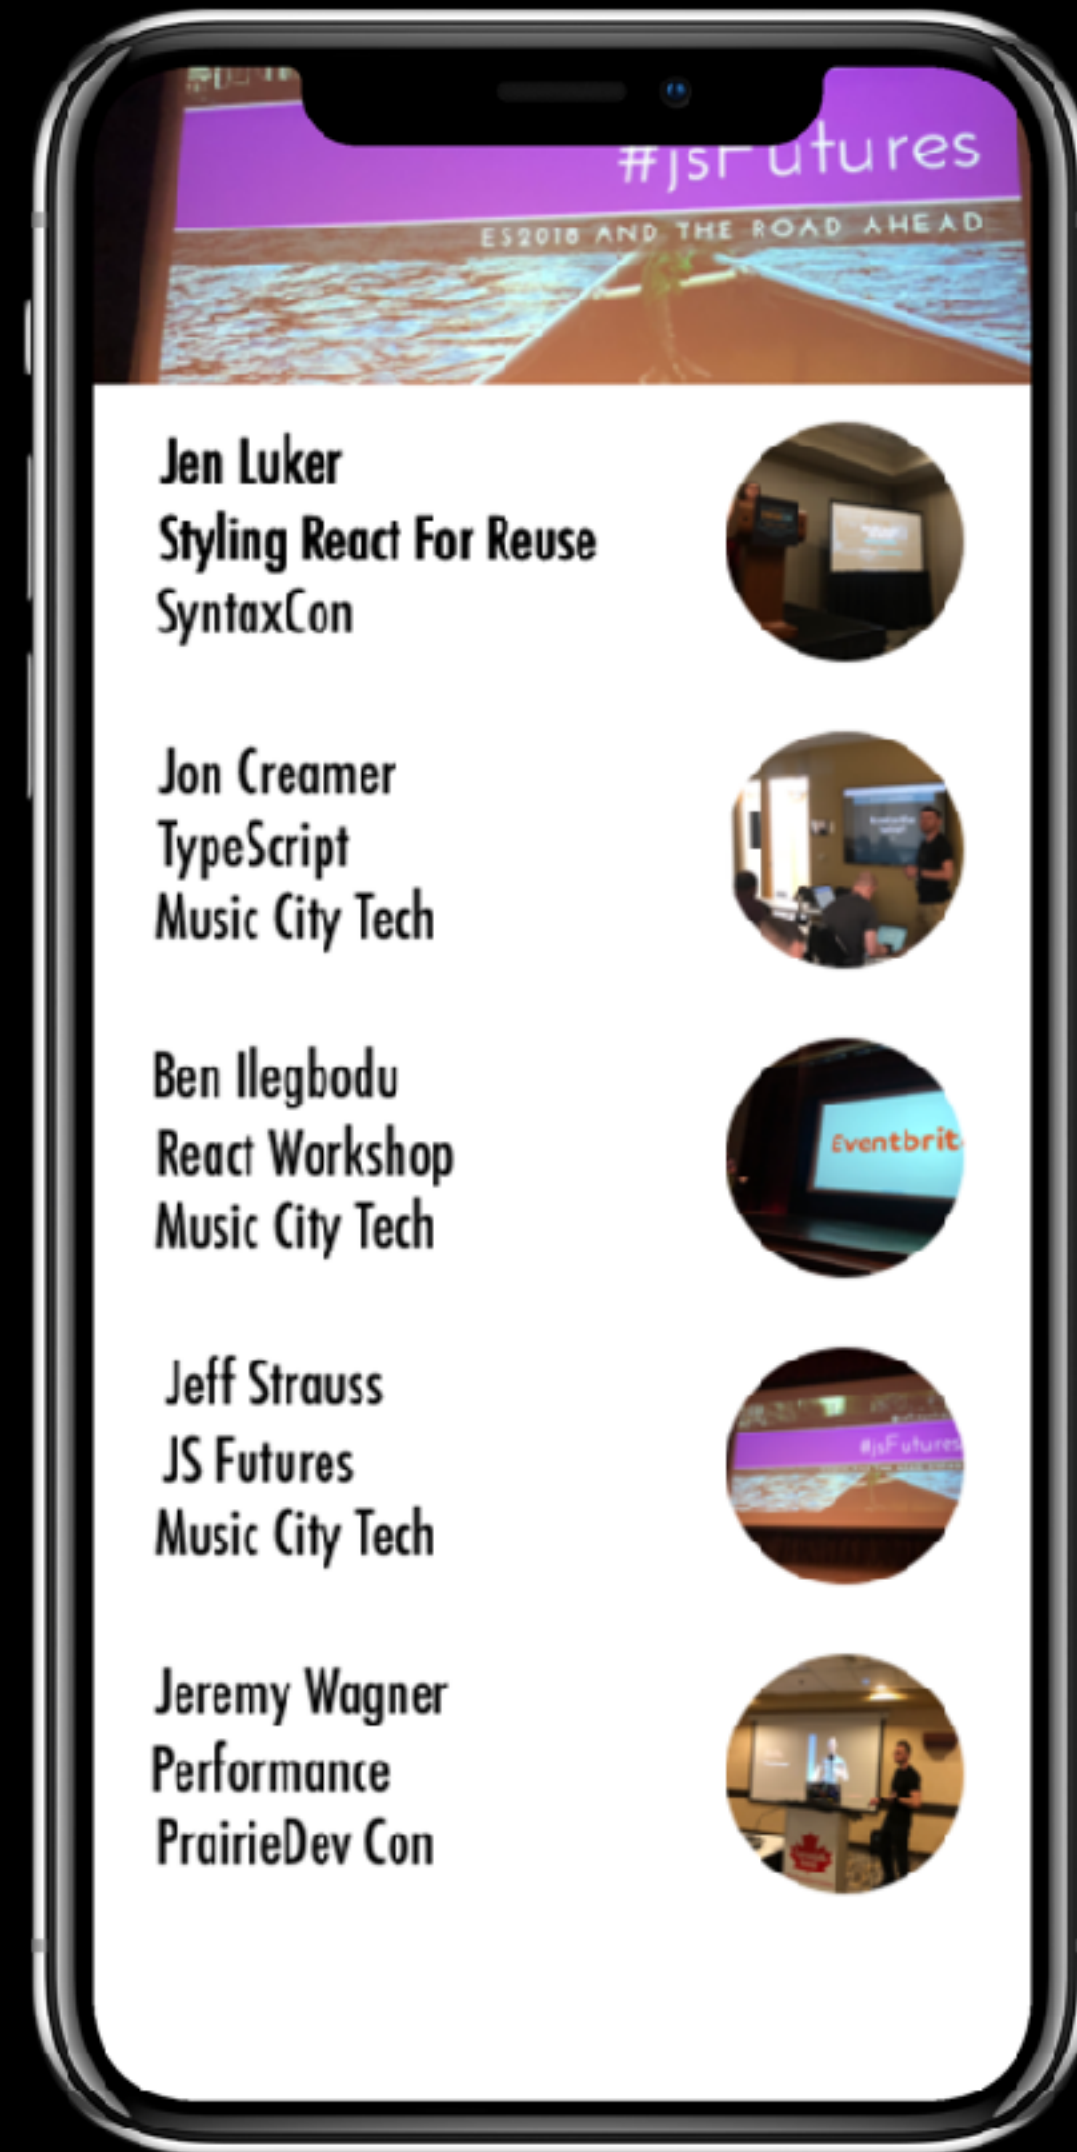

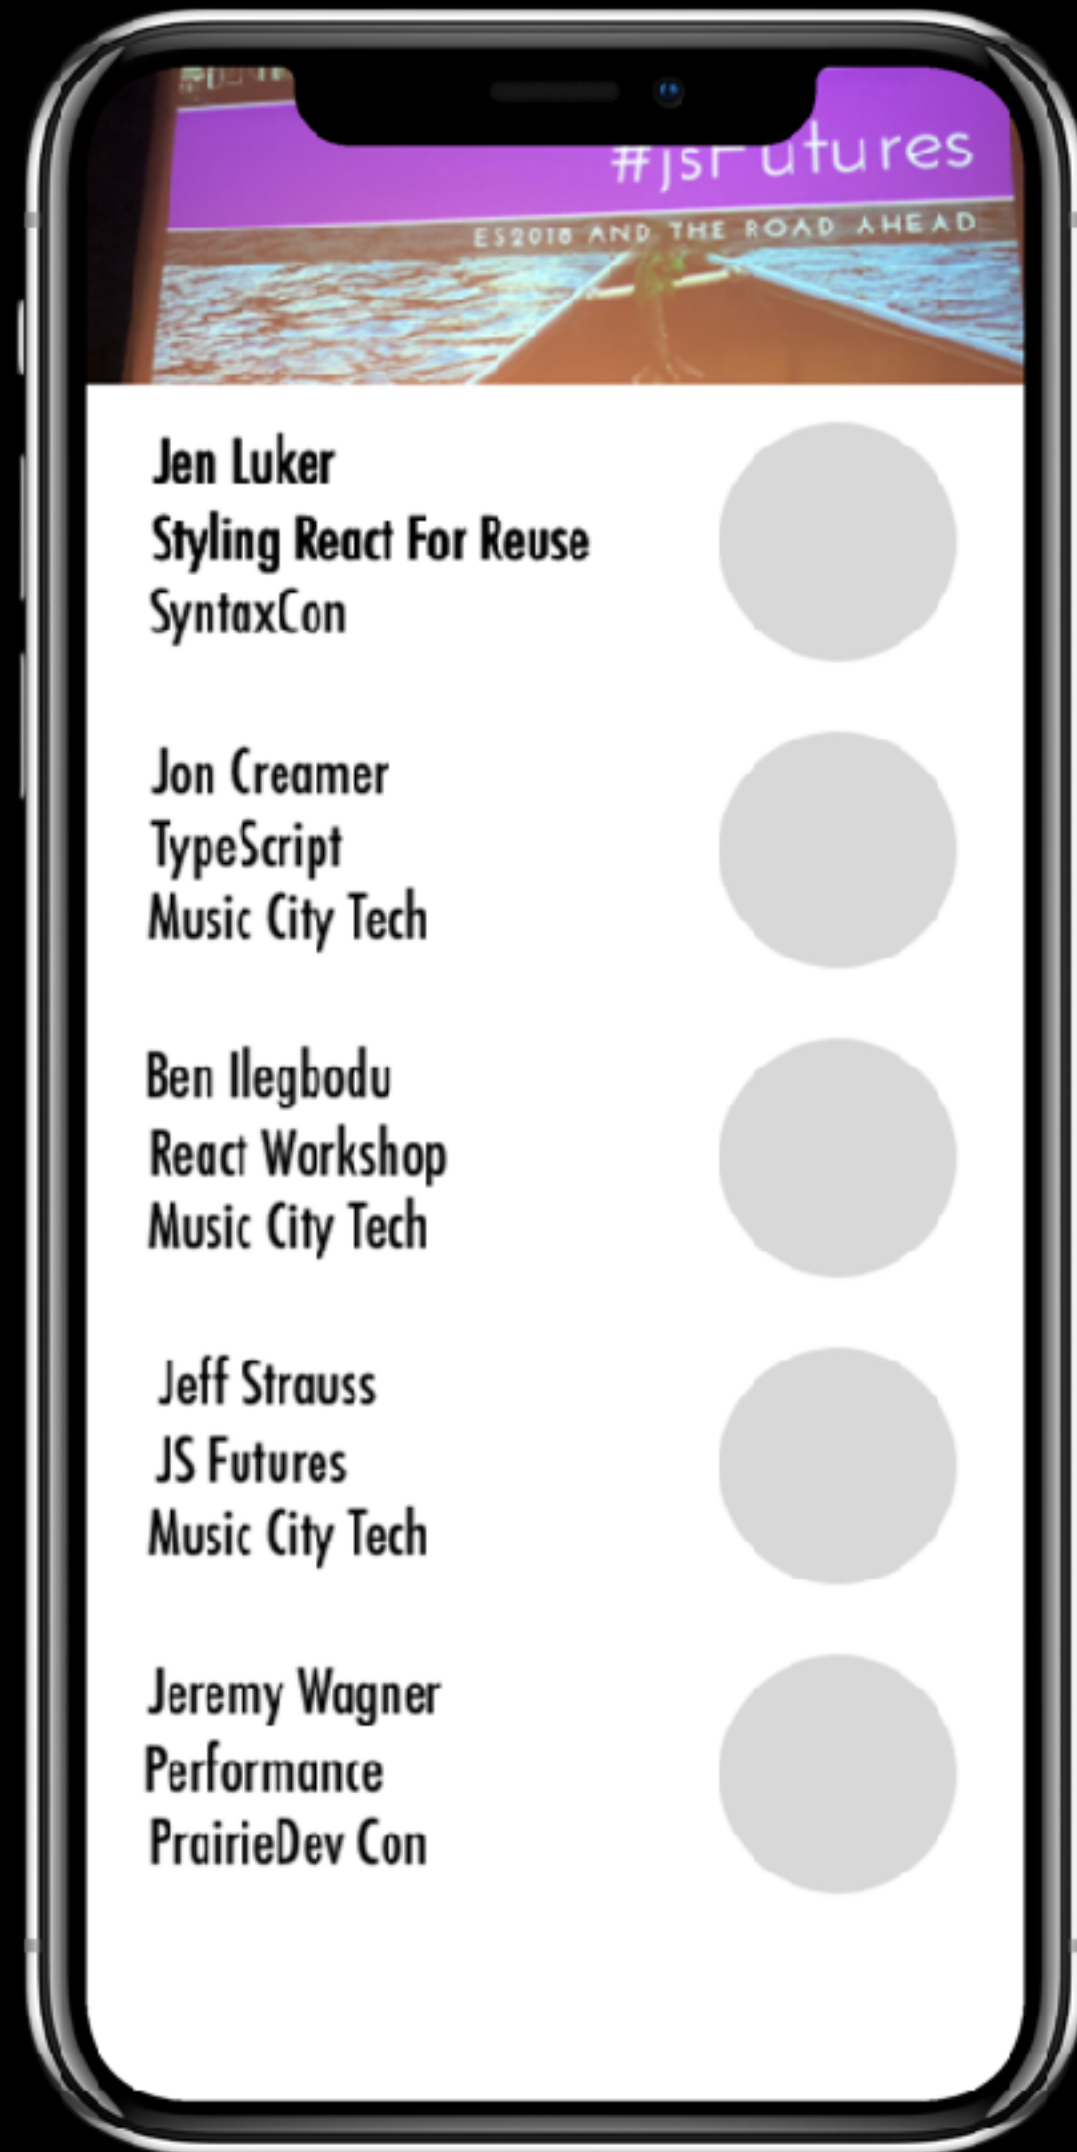

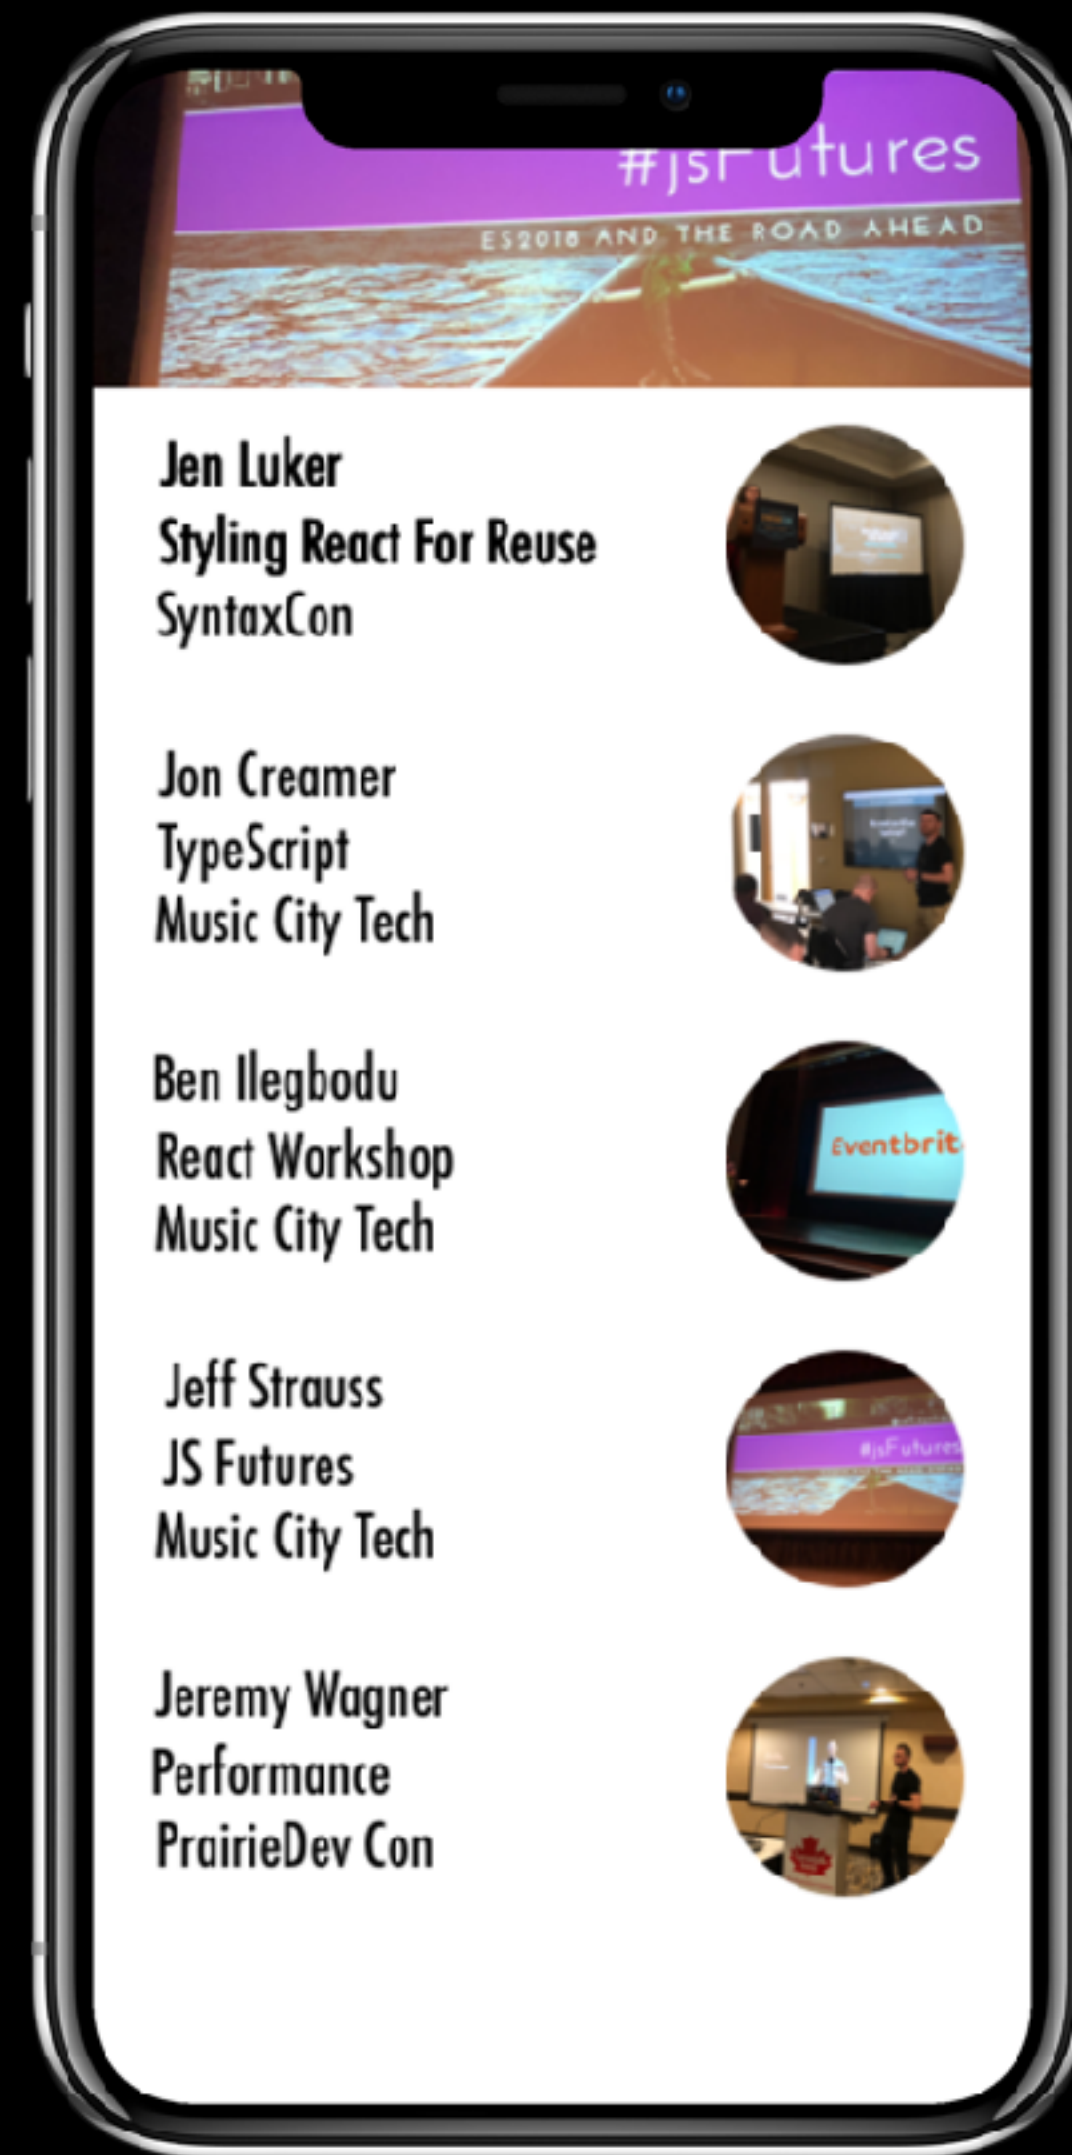

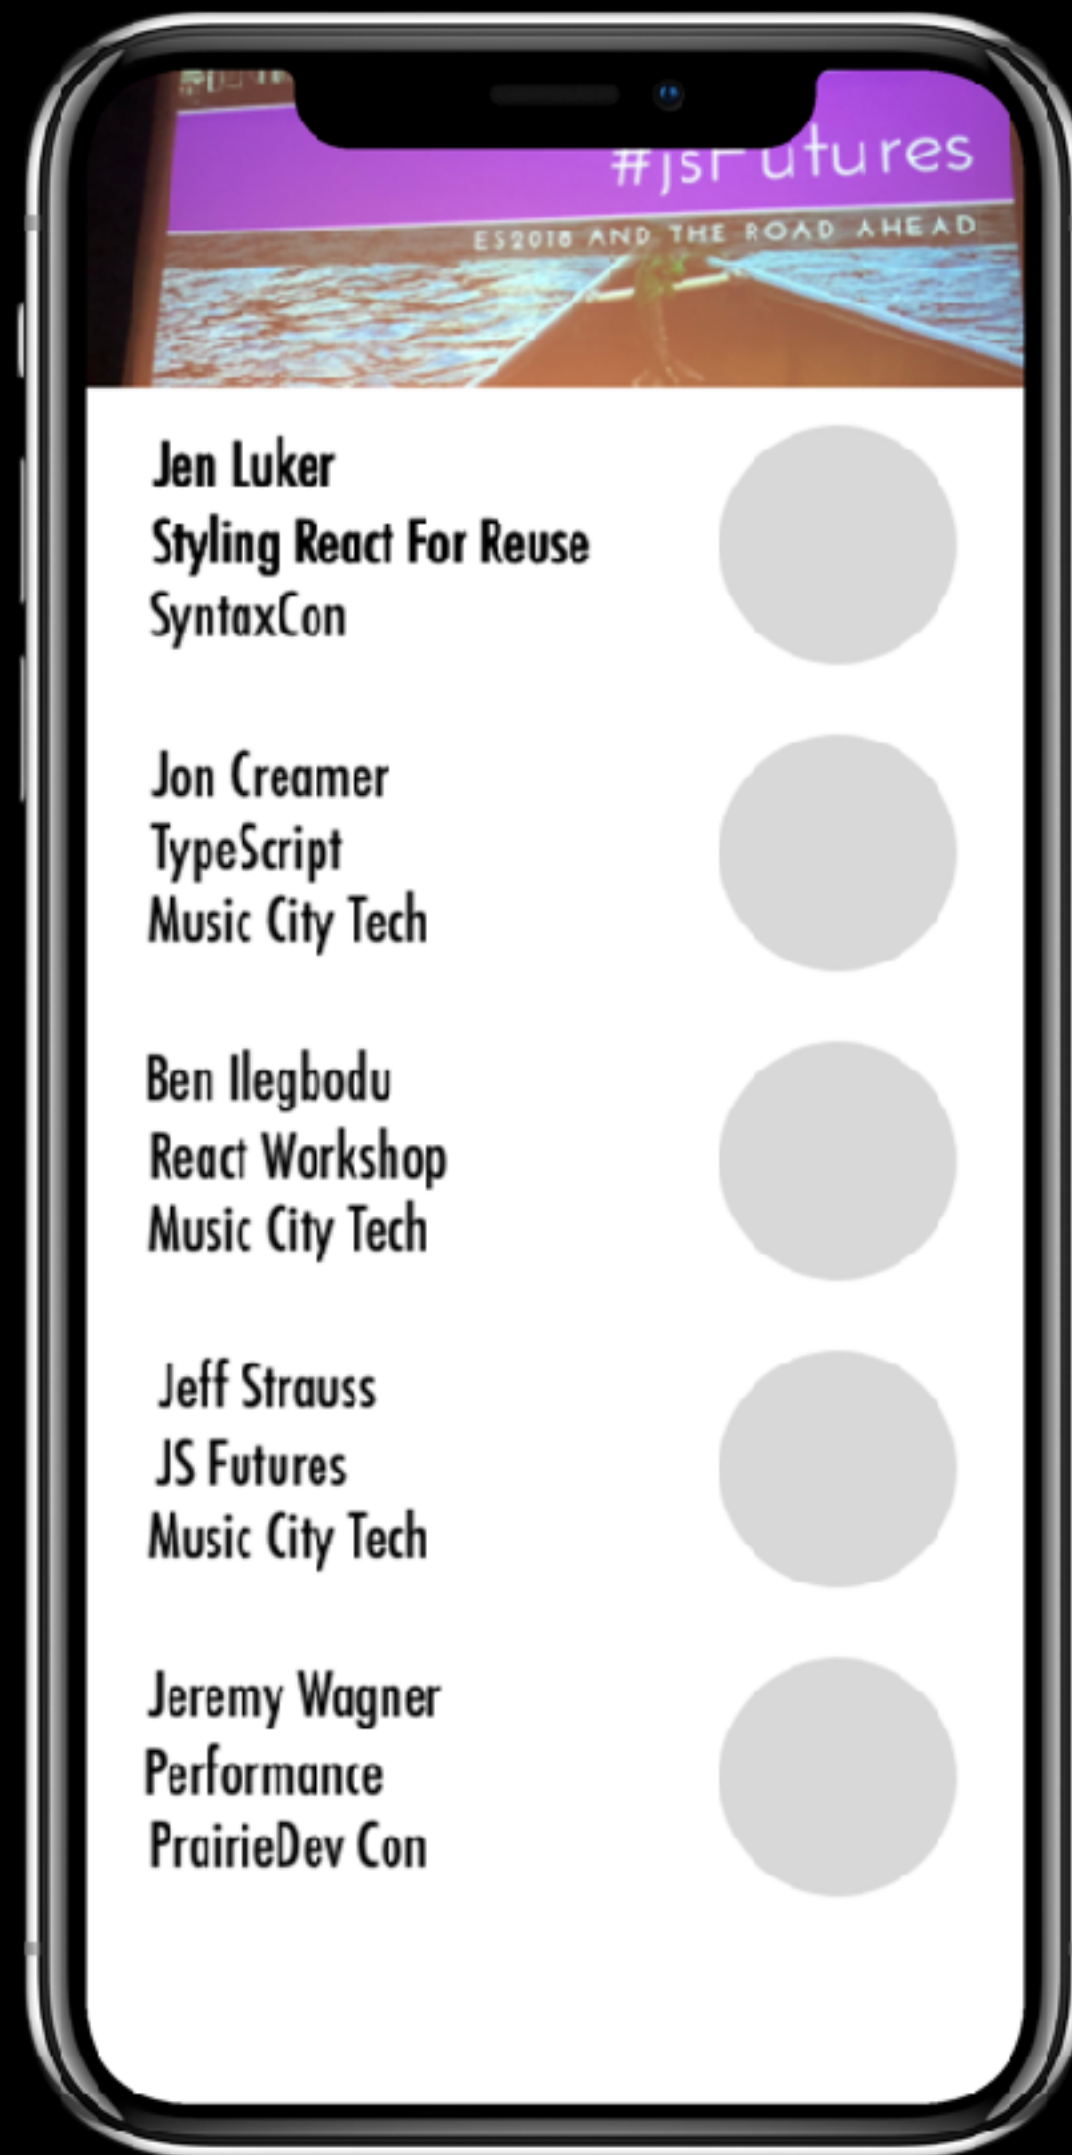

"Users *don't care* about performance stats in terminal, they *do care* about what they see in front of them."

- Callum Hart

“Design for *operational transparency* by providing progress-UX that’s robust and meaningful.”

- Nick Babich
