Unified visibility across your entire ecosystem

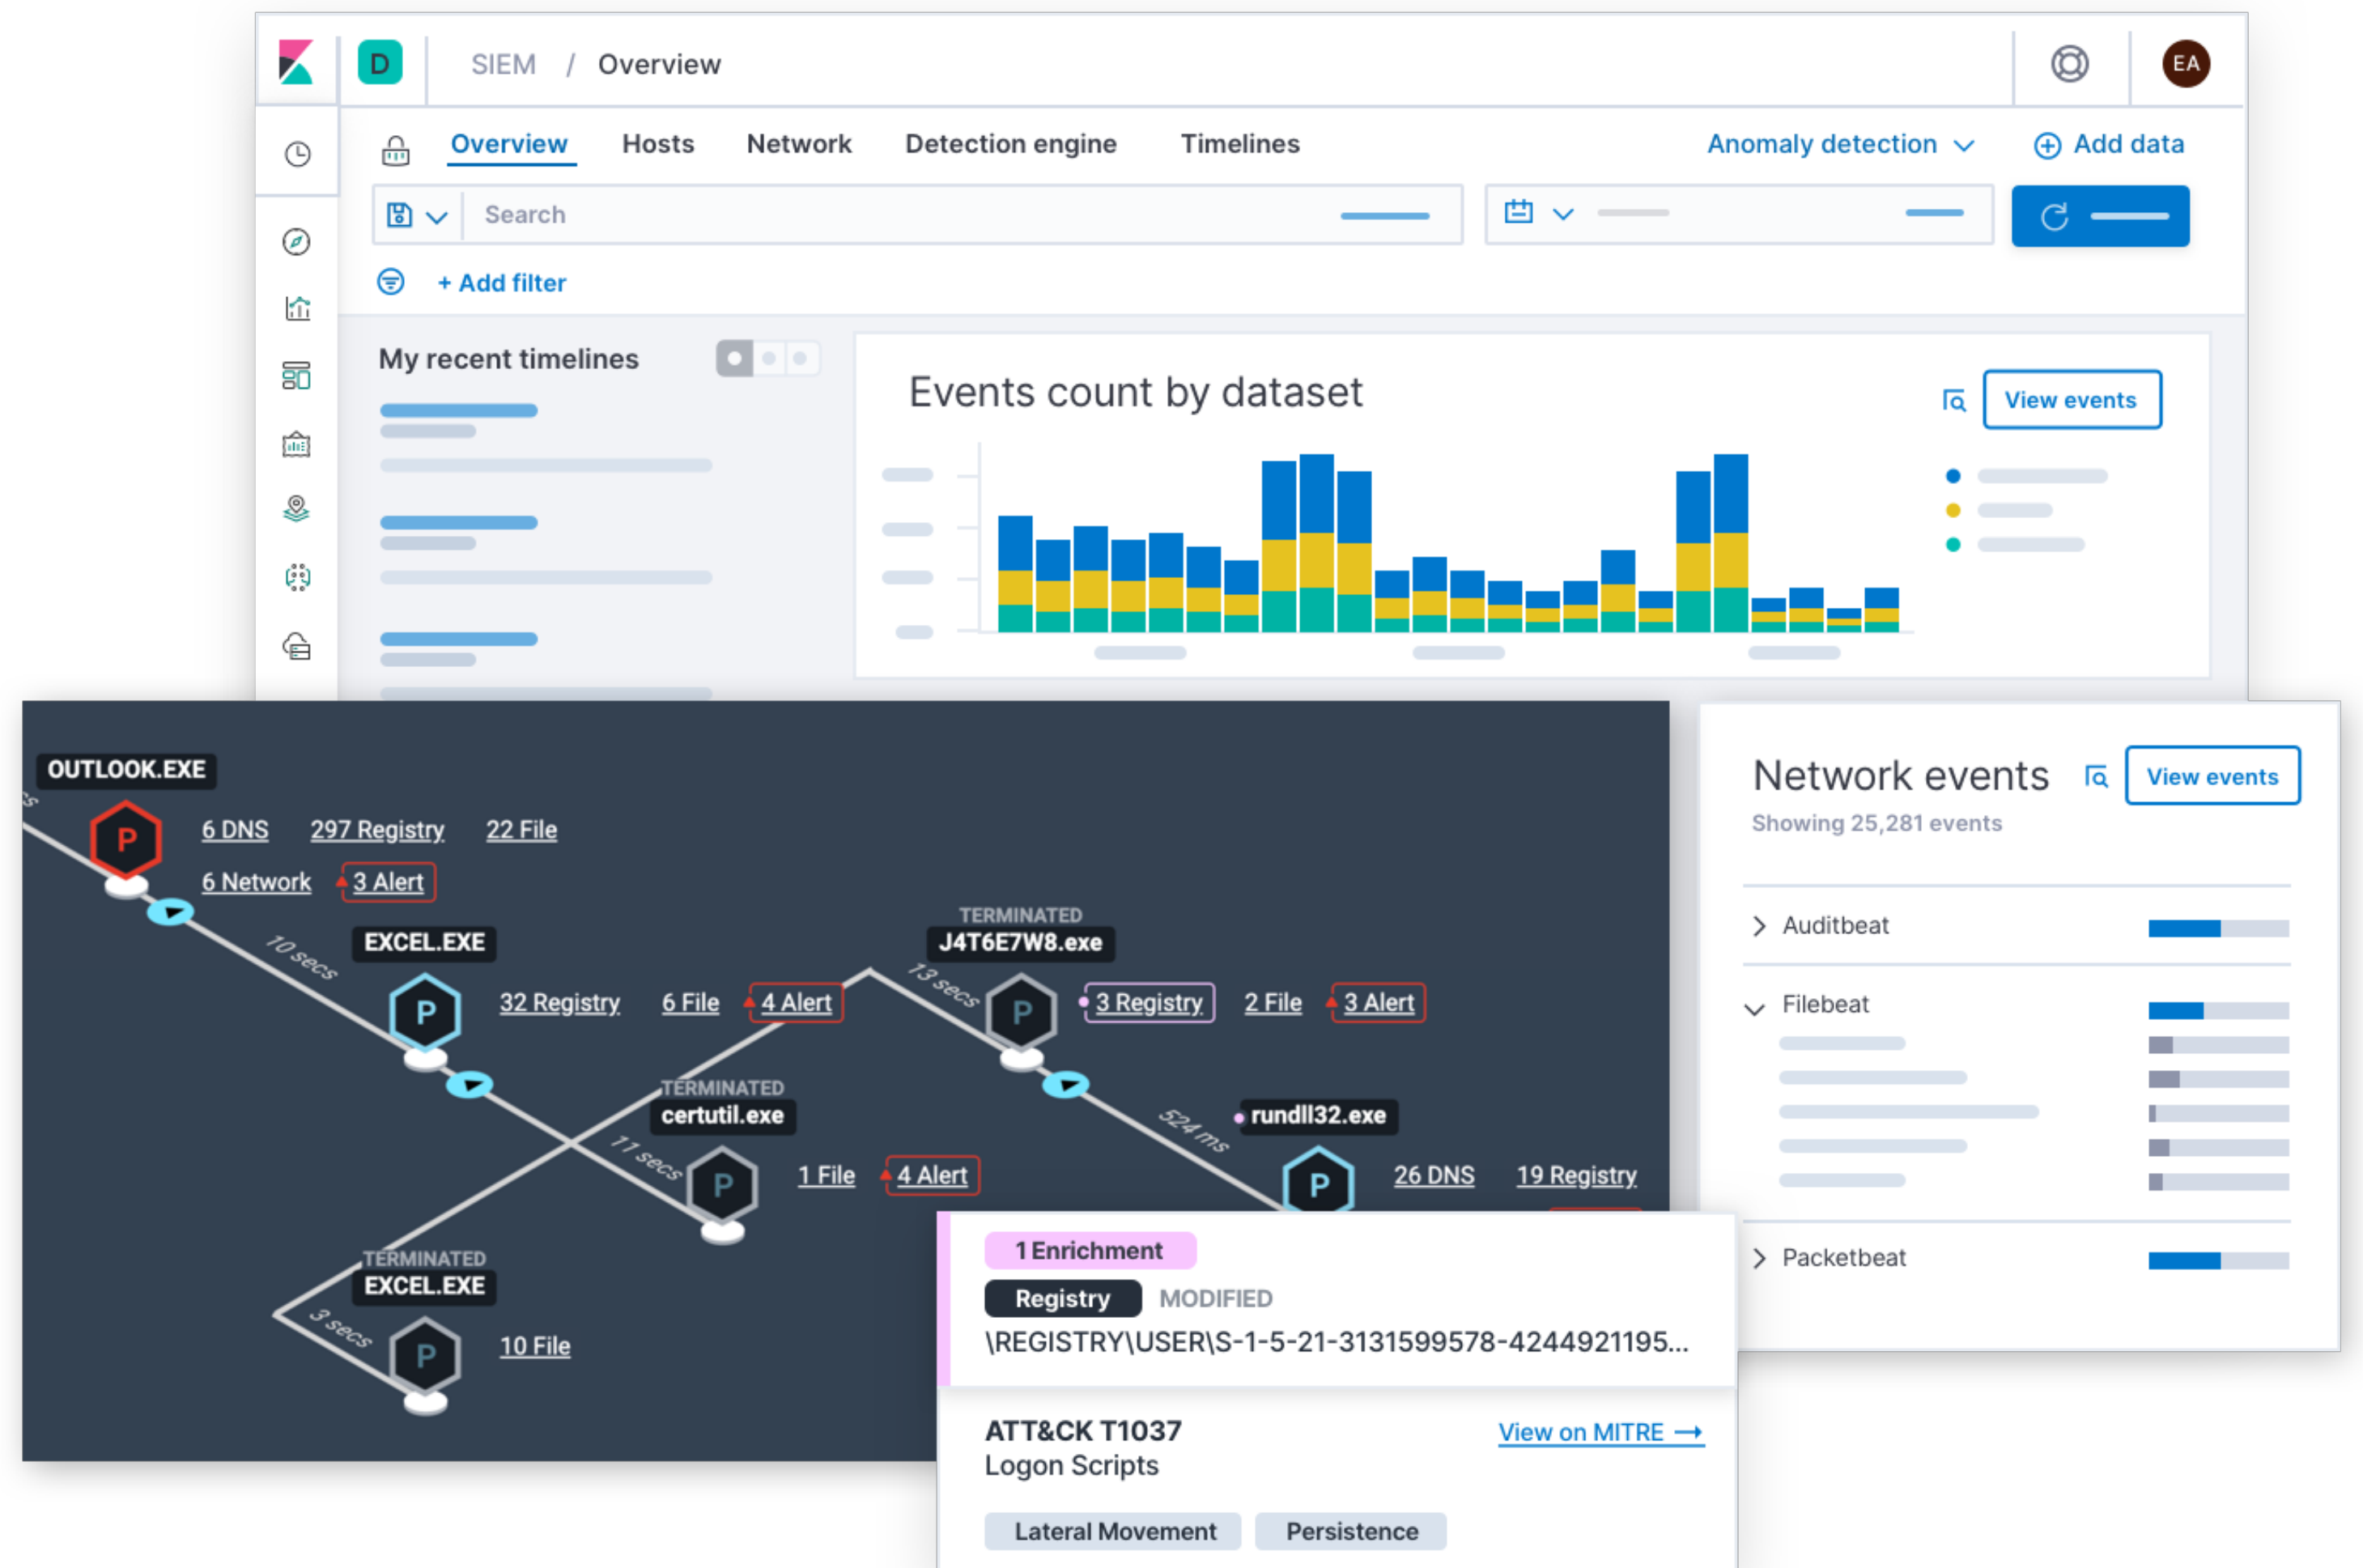

Bring your logs, metrics, and traces together into a single stack so you can monitor, detect, and react to events with speed.

Security how it should be: open

Elastic Security integrates endpoint security and SIEM to give you prevention, collection, detection, and response capabilities for unified protection across your infrastructure.

Apache Tika - a content analysis toolkit

The Apache Tika™ toolkit detects and extracts metadata and text from over a thousand different file types (such as PPT, XLS, and PDF). All of these file types can be parsed through a single interface, making Tika useful for search engine indexing, content analysis, translation, and much more. You can find the latest release on the [download page](#). Please see the [Getting Started](#) page for more information on how to start using Tika.

The [Parser](#) and [Detector](#) pages describe the main interfaces of Tika and how they work.

For more in-depth documentation, see our [wiki](#) , especially for [tika-server](#) .

If you're interested in contributing to Tika, please see the [Contributing](#) page or send an email to the [Tika development list](#).

Tika is a project of the [Apache Software Foundation](#) , and was formerly a subproject of [Apache Lucene](#) .

Parsing a stream

and getting content and metadata

```
static void extractTextAndMetadata(InputStream stream) throws Exception {
    BodyContentHandler handler = new BodyContentHandler();
    Metadata metadata = new Metadata();
    try (stream) {
        new DefaultParser().parse(stream, handler, metadata, new ParseContext());
        String extractedText = handler.toString();
        String title = metadata.get(TikaCoreProperties.TITLE);
        String keywords = metadata.get(TikaCoreProperties.KEYWORDS);
        String author = metadata.get(TikaCoreProperties.CREATOR);
    }
}
```

[« Ingest Plugins](#)[Using the Attachment Processor in a Pipeline »](#)

Ingest Attachment Processor Plugin

The ingest attachment plugin lets Elasticsearch extract file attachments in common formats (such as PPT, XLS, and PDF) by using the Apache text extraction library [Tika](#).

You can use the ingest attachment plugin as a replacement for the mapper attachment plugin.

The source field must be a base64 encoded binary. If you do not want to incur the overhead of converting back and forth between base64, you can use the CBOR format instead of JSON and specify the field as a bytes array instead of a string representation. The processor will skip the base64 decoding then.

Installation

This plugin can be installed using the plugin manager:

```
sudo bin/elasticsearch-plugin install ingest-attachment
```

The plugin must be installed on every node in the cluster, and each node must be restarted after installation.
