

Built Environments: Leading the Way in Indoor Air Quality Solutions

With the increasing pollution level and rising Air Quality Index. It becomes a matter of concern for people of every age group to inhale fresh air! Whether you are staying indoors or outdoors, the problem of reducing air quality is alarming. With Built Environments, you can ensure that you receive the best service to improve the air quality. With their indoor air quality and [mold testing Saskatoon](#), you can combat the problem of poor air quality with ease.

This Facebook account <https://www.facebook.com/builtenvironments.ca/> will introduce you to this service.

Ventilation Improvement

Building a proper Ventilation system can reduce air pollution by 50%. Built Environments assures that you inhale fresh air by making a smart investment in installing exhaust fans and HEPA (high-efficiency particulate air). It can remove 99% of air pollutants and release fresh air. Additionally, you can also have air handling units to filter the air before circulating in the whole building.

Reduce Chemical Usage

Reducing chemical usage while cleaning purposes. You can replace the toxic cleaning device with low-emission products that may cause less harm to your body. [air quality testing Saskatoon](#) is one of the best ways to identify the percentage of asbestos in the air. Built Environments help provide non-hazardous solutions to safeguard your indoors. Save yourself from lung tissue scarring, breathing difficulties, chest pain, chronic lung disease, and coughing with the help of this service.

Adopt Green Building

A green environment is a clean environment. You must invest in energy-efficient building techniques that can improve the air circulation. It can reduce the need for artificial lighting and also help maintain a balance of improved air inhalation. Additionally, you can select low-emission construction materials such as green concrete, hempcrete, and recycled steel. Built Environments ensure you can adapt to all these practices in a seamless way.

Control Humidity Level

Using dehumidifiers can help you prevent mold growth and also reduce air pollutants. You can reduce dust mite growth by investing in an efficient dehumidifier system. These dust mites produce microscopic organisms that can cause serious life threats to the human body.

Built Environments specializes in assessing workplaces and residents. It effectively manages hazards like asbestos, mold, and indoor pollutants. A certified [hazardous material assessment](#) inspector from Built Environments can help you plan your renovation or help in creating better,

safer indoor environments with their testing services. If your priority is the best top quality services then this is the best you can get!
