

5 COMMON REFRIGERATOR ISSUES AND WAYS TO FIX IT

The refrigerator being the most important part of the kitchen requires attention and maintenance at regular intervals. If you miss doing that, you might face severe loss of resources, produce, money, and time in the future. There are 5 common issues that a fridge might face and can be resolved easily just by getting help from [Fridge Repair Service Near Me](#). It will save you so much time and energy because these common issues can cause some serious troubles in your fridge if not taken care of on time. So in this blog, you will relate to 5 common fridge issues and learn to repair them.

5 COMMON REFRIGERATOR ISSUES AND WAYS TO FIX IT

1. REFRIGERATOR IS TOO WARM

If your refrigerator is warmer than the suggested temperature of between 37 and 41 degrees, you should try following the steps-

- Check the power supply and correct it
- Keep the thermostat at ideal temperature
- Clean the vents for both fridge and freezer
- Clean the coils

And if you still have trouble keeping it at the standard temperature, you should get help from the experts in fridge maintenance and repairs.

2. EVERYTHING IN THE REFRIGERATOR IS FREEZING

If you find out that everything and every produce in your fridge is freezing to the level of rock, it sure is an issue with the thermostat, thermistor, or temperature control board as they together control the temperature of the fridge.

- Check the thermostat by taking it to the highest level and if you hear a click sound, that is surely broken.
- Adjust your temperature by keeping the thermostat at 40 degrees Fahrenheit.

If you are still not able to resolve the issue, search for [Fridge repair near me](#) to get professional help.

3. REFRIGERATOR IS MAKING TOO MUCH NOISE

It is common for a fridge to make a small noise while operating but if your fridge is making an unusual noise then check if-

- Any wear or tear on the fan for the condenser
- Unplug and re-plug the appliance
- Clean for dust on fan

If still not resolved get your motor and other parts checked by a repair expert.

4. THE FREEZER HAS FROST BUILDUP

If your fridge is not receiving enough warm and moist air, it will be prone to building ice in your fridge.

- Check if the door seal is broken or damaged.

If yes, then get it replaced, and if not then it must be an issue of the refrigerator defrost system. Find the best [Fridge Repair Service Near Me](#) to resolve the issue.

5. BROKEN ICE MAKER OR WATER DISPENSER

Modern fridges have automatic water dispensing lines and an ice maker feature and if any of them is not working efficiently, you can do the following things to troubleshoot-

- Check for any kinks or tears in the water supply line.
- Open the water inlet valve if not
- Clean debris from the water filter and change if needed.
