The time traveller's guide to web technologies

Phil Hawksworth

he/him

17th September 2025

- Intro song: Any song you'd like us to play as you walk on stage.

- Intro song: Any song you'd like us to play as you walk on stage. If nothing comes to mind, don't worry — we'll have you covered 😊
- Pronouns: What pronouns do you prefer? Helpful for us to know when introducing you.

And one last note: it's really important for us to keep to the schedule so that every speaker and the audience can fully enjoy the flow of the event. If a talk runs a bit long, after a while we'll gently fade in some music and gradually turn it up. It's our friendliest way of keeping things moving — we hope that feels okay for you! 🎵

Thanks so much for sending us your details soon. We can't wait to see you on stage — and to welcome you to Sweden! 🇸🇪

Any song

Spiralling into self reflection and a crisis of confidence when asked nicely by a conference:

"What walk-on music would you like?"

I might need a FigJam board, a Notion document, and some focus groups to help me figure this one out.

Help me Bluesky friends. You're my only hope.

Ajax: A New Approach to Web Applications

by **Jesse James Garrett**

February 18, 2005

If anything about current interaction design can be called “glamorous,” it’s creating Web applications. After all, when was the last time you heard someone rave about the interaction design of a product that wasn’t on the Web? (Okay, besides the iPod.) All the cool, innovative new projects are online.

Despite this, Web interaction designers can’t help but feel a little envious of our colleagues who create desktop software. Desktop applications have a richness and responsiveness that has seemed out of reach on the Web. The same simplicity that enabled the Web’s rapid proliferation also creates a gap between the experiences we can provide and the experiences users can get from a desktop application.

That gap is closing. Take a look at [Google Suggest](#). Watch the way the suggested terms update as you type, almost instantly. Now look at [Google Maps](#). Zoom in. Use your cursor to grab the map and scroll around a bit. Again, everything happens almost instantly, with no waiting for pages to reload.

Google Suggest and Google Maps are two examples of a new approach to web applications that we at Adaptive Path have been calling Ajax. The name is shorthand for Asynchronous JavaScript + XML, and it represents a fundamental shift in what’s possible on the Web.

Defining Ajax

Ajax isn’t a technology. It’s really several technologies, each flourishing in its own right, coming together in powerful new ways. Ajax incorporates:

A confession

```
document.getElementById("some-id");
```

Library and utility functions.

```
function getById(id) {  
    return document.getElementById(id) || null;  
}
```

Library and utility functions.

```
function $(id) {  
    return document.getElementById(id) || null;  
}
```

March 2006

**John Resig pushes the
first commits to jQuery**

jquery.com

jQuery New Wave Javascript

jQuery is a new type of Javascript library. It is not a huge, bloated, framework promising the best in AJAX - nor is just a set of needlessly complex enhancements - **jQuery is designed to change the way that you write Javascript.**

New: The [jQuery Mailing List](#) is now up - join and discuss!

New: The [jQuery Blog](#) has just been opened - [subscribe now!](#)

What is jQuery?

jQuery is a Javascript library that takes this motto to heart: **Writing Javascript code should be fun.** jQuery achieves this goal by taking common, repetitive, tasks, stripping out all the unnecessary markup, and leaving them short, smart and understandable.

What does jQuery code look like? **The quick and dirty:**

```
$("p.surprise").addClass("ohmy").show("slow");
```

» Run

New. The [jQuery Blog](#) has just been opened - [subscribe now!](#)

What is jQuery?

jQuery is a Javascript library that takes this motto to heart: **Writing Javascript code should be fun.** jQuery achieves this goal by taking common, repetitive, tasks, stripping out all the unnecessary markup, and leaving them short, smart and understandable.

What does jQuery code look like? **The quick and dirty:**

```
$("p.surprise").addClass("ohmy").show("slow");
```

» Run

The above code snippet looks for all paragraphs that have a class of 'surprise', adds the class 'ohmy' to them, then slowly reveals them. Click the 'Run' button to see it in action!

Quick Facts:

- jQuery supports [CSS 1-3](#) and basic [XPath](#).

Writing JavaScript should be fun
