**The series creators have said that the Clangers, living in vacuum, did not actually communicate by sound, but rather by a type of nuclear magnetic resonance, which was translated to audible whistles for the human audience. These whistles followed the **rhythm and intonation** of a script in the English language, including swear-words.**

## Earth 'not at risk' from collider

By Paul Rincon  
Science reporter, BBC News

**Our planet is not at risk from the world's most powerful particle physics experiment, a report has concluded.**

The document addresses fears that the Large Hadron Collider is so energetic, it could have unforeseen consequences.

Critics are worried that mini-black holes made at the soon-to-open facility on the French-Swiss border might threaten the Earth's very existence.

But the report, issued the European Organization for Nuclear Research, says there is "no conceivable danger".

The organization - known better by its French acronym, Cern - will operate the collider underground in a 27km-long tunnel near Geneva.

This Large Hadron Collider (LHC) is a powerful and complicated machine, which will smash together protons at super-fast speeds in a bid to unlock the secrets of the Universe.

Six "detectors" - individual experiments - will count, trace and analyse the particles that emerge from the collisions.

Atlas is the biggest experiment housed at the LHC

### Example Apps

- [Site Connectivity](#)
- [My Connections](#)
- [Parameter Playground](#)

### What does this demo show?

This demo shows the list of web URLs that are connected to the ones you entered. The first section lists all contacts you've linked to. Below that is a list of all contacts who have linked to you, using relationships like 'friend', 'kin' or 'colleague'

### Where do these URLs come from?

These are public links on websites, marked up using Open standards such as [XFN](#) and [FOAF](#), designed to express relationships online.

To use XFN to connect sites, add `rel="friend"` to your link like this:

```
<a href="http://bradfitz.com"
rel="friend" >Brad</a>
```

[More details on XFN.](#)

To use FOAF, create a FOAF file and link to it from your web page. [More details on FOAF.](#)

### What is the Social Graph API?

The [Social Graph API](#) makes information about the public connections between people on the Web easily available and useful for developers. Developers can query this public information to offer their users dramatically streamlined "add friends" functionality and other useful features.
