What Is Robotic Spine Surgery?

Robotic Spine Surgery or robot-assisted spine surgery combines advanced computer technology with the skill and experience of long-time spine surgeons and neurosurgeons. The technology enables surgeons to view the intricate anatomy of the body in high-definition 3D imaging.

The surgeon can use controls to control the robot that handles the special surgical equipment. The robot, controlled by the surgeon via a console is much more maneuverable and flexible than a human hand. The robot copies the surgeon's movements without the vibrations or hands tremors. This allows the surgeon precision and control in even the most complex procedures.

What Causes the Need for Robotic Spine Surgery?

Robotic spine surgery is an advanced and advantageous surgery for patients suffering from major spine conditions or diseases. The surgery is considered in the case of patients who have been suffering from major spine issues that are restricting them from living a normal lifestyle and performing day-to-day activities.

It is usually considered a treatment where treatments such as medicines and physiotherapy are not working.
