

Orchestrate the Chaos:

Process automation in modern architectures

WebSummit Lisbon | November 15, 2023

Hello!

Mia Moore

@xoMiaMoore

they/them

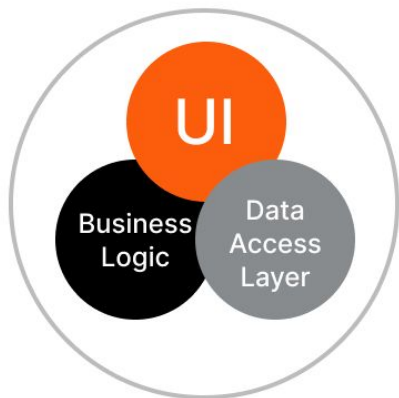

- Technical Community Builder @ Camunda
- Just moved from Austin, TX → Seattle, WA
- Fun fact: I love birdwatching

Poll

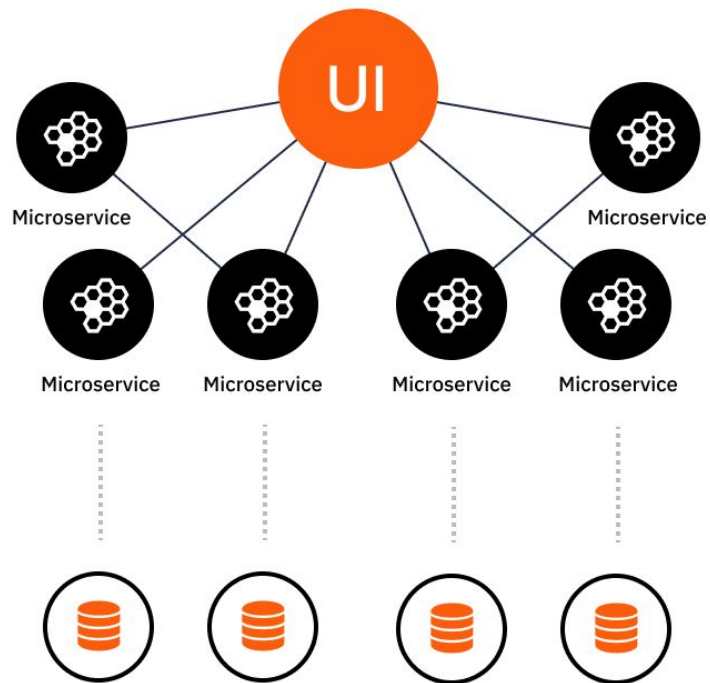

- How many consider themselves technical?
- How many here use microservice architectures?
- Has anyone struggled to explain or understand data flow/logic, especially between technical and non-technical teams?
- Has anyone heard of BPMN? DMN? BPM?
- Has anyone heard of Camunda?

**What is “Modern
Software Architecture”?**

Monolithic Architecture

Microservices Architecture

**Modern architecture designs
are great at optimizing
resource usage ...**

**... now diagram the
business logic / data
flow ...**

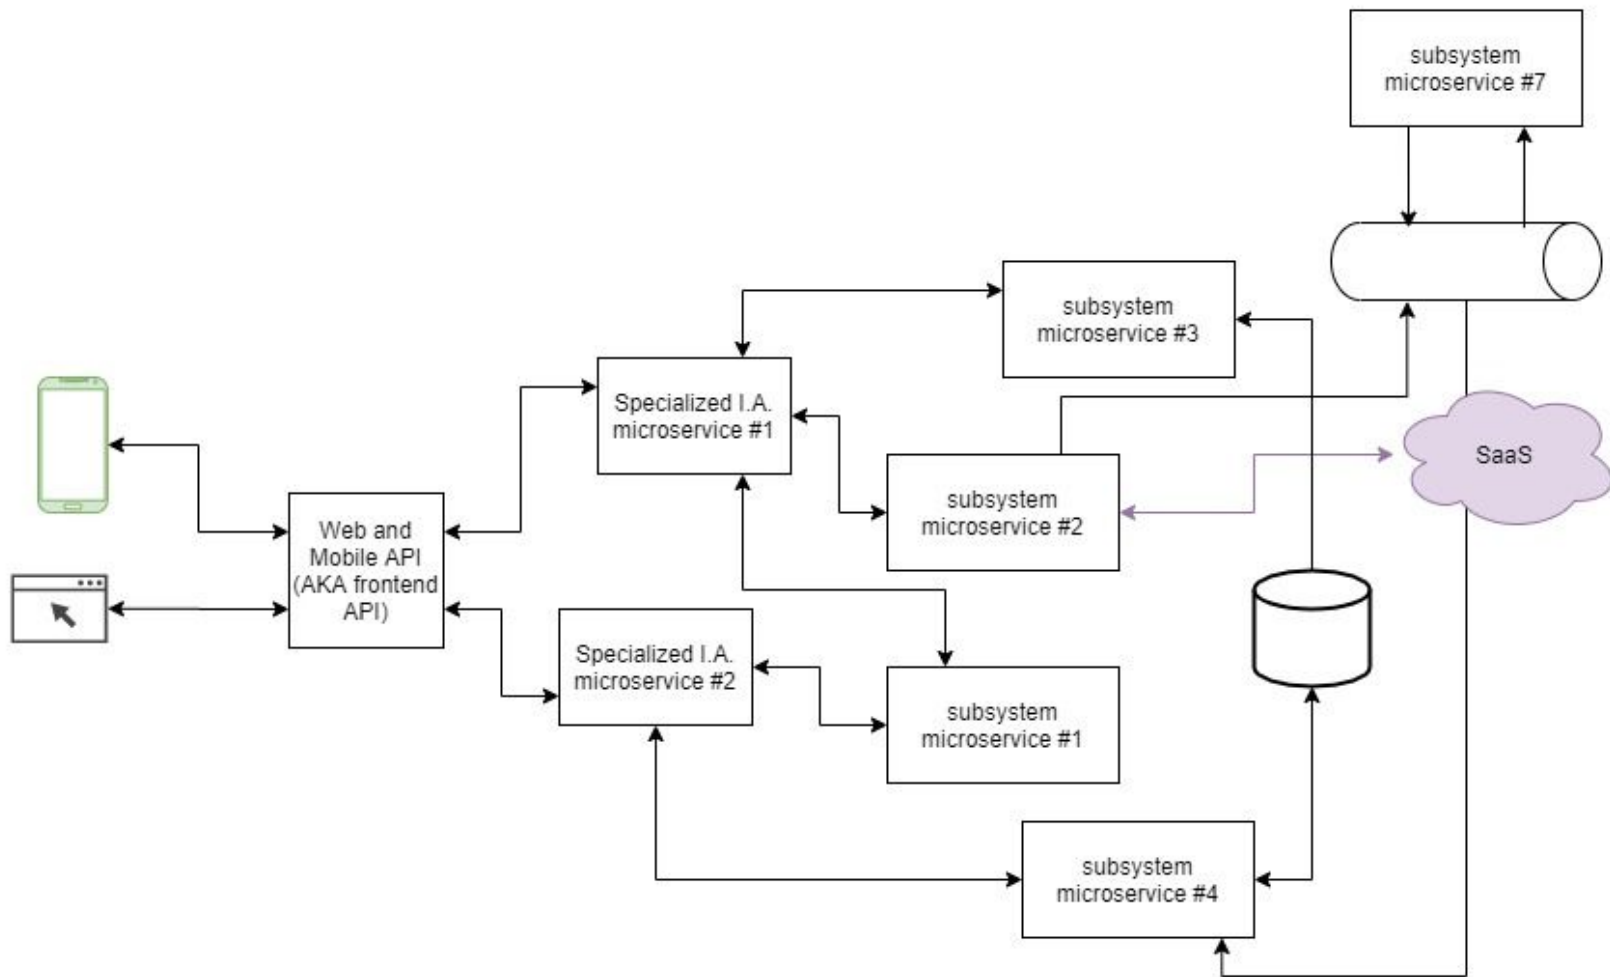

Image: ("Microservices" - KRAZAM) <https://www.youtube.com/watch?v=y8OnoxKotPQ>

Hard problems to solve

Documentation

Data flow diagrams look like spaghetti

Timers

Alerts, stuck/idle processes, notifications

Interrupting messages

Your application is already executing code, but something has changed and you need to interrupt it and handle it differently

Changes to business logic

All your services are running nicely together, but now a new service is added that integrates with other existing services

Forget services and infrastructure. Let's think about it in terms of *processes*.

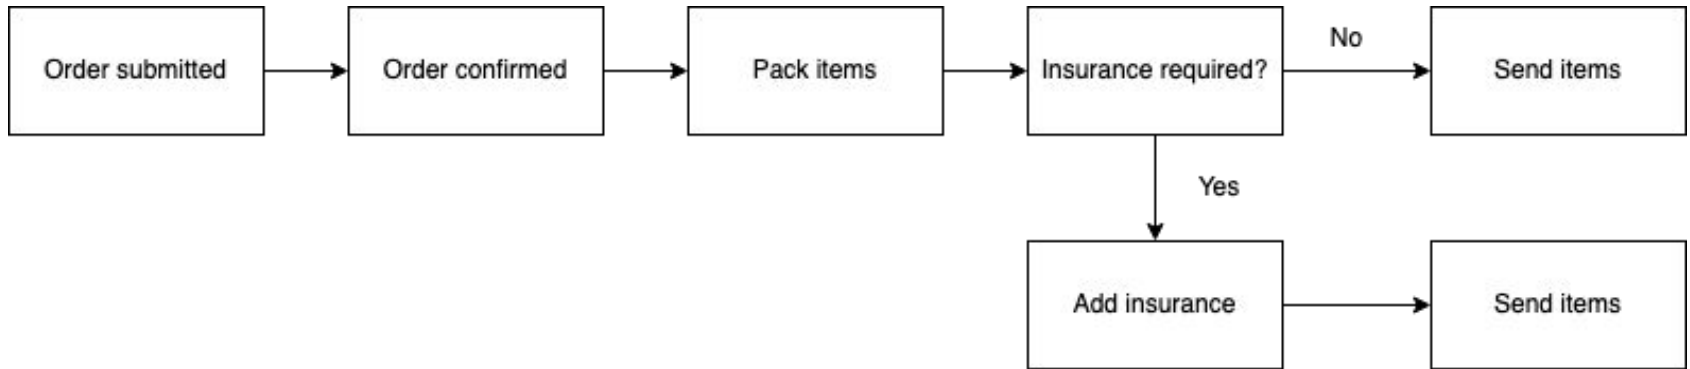

Processes?

“... a collection of related, structured activities or tasks performed by people or equipment.”

Order fulfillment process

Real World Scenario

Truck Permits

A local municipality needs to issue permits to trucking companies:

- Trucking company fills out a form
- A price is determined for the permit
- The company pays for the permit
- The permit is issued

Truck Permits

A local municipality needs to issue permits to trucking companies:

- Trucking company fills out a form
-> **UserForm microservice**
- A price is determined for the permit
-> **PermitMatch microservice**
- The company pays for the permit
-> **Payments microservice**
- The permit is issued
-> **IssuePermit microservice**

New requirement!

“We need the permit turned into a **PDF**, and **email notifications** to the user and to us.”

Truck Permits

A local municipality needs to issue permits to trucking companies:

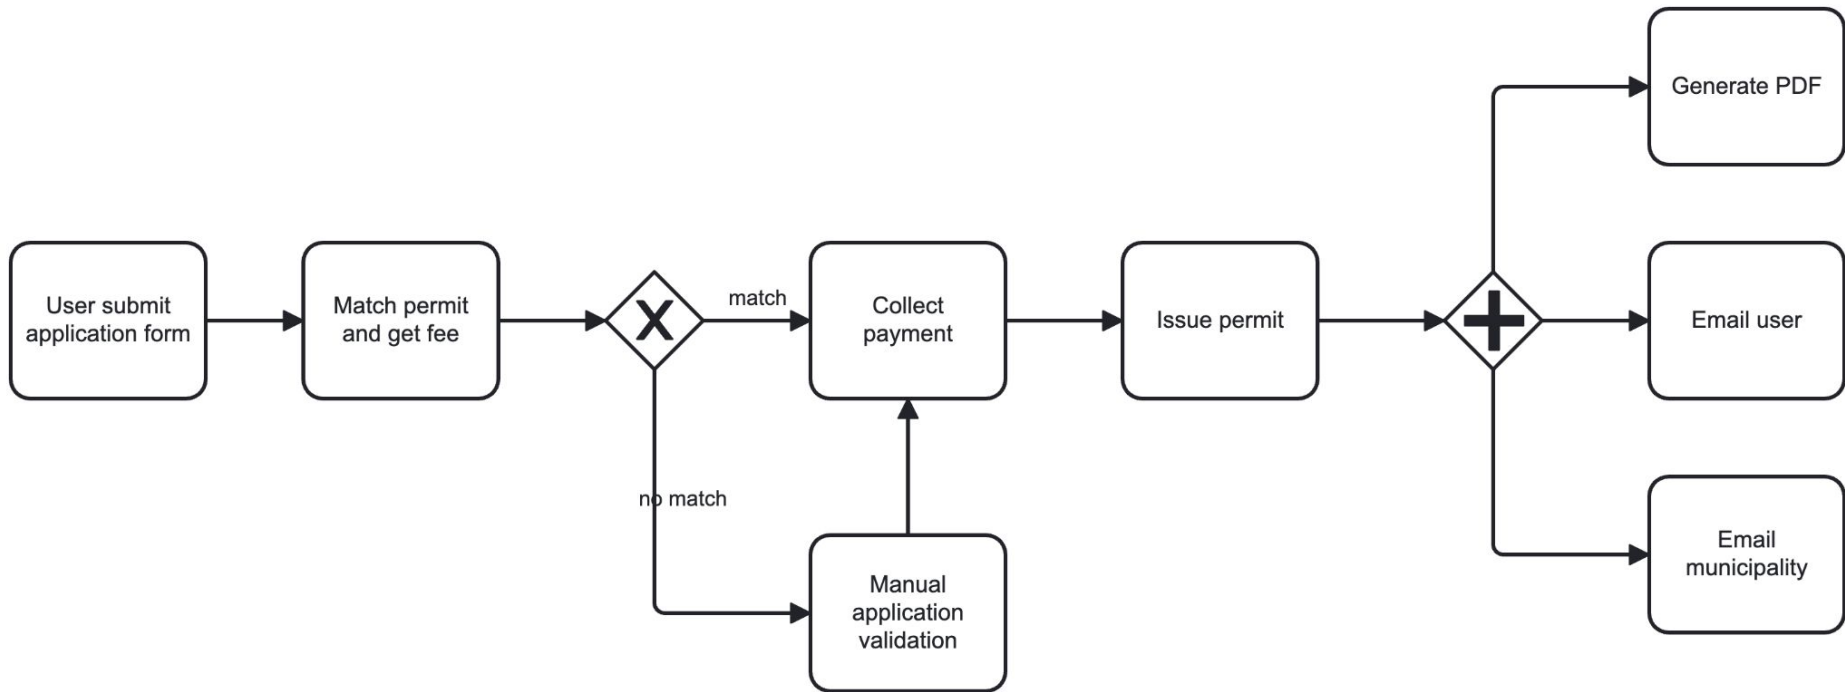

- Trucking company fills out a form
-> **UserForm microservice**
- A price is determined for the permit
-> **PermitMatch microservice**
- The company pays for the permit
-> **Payments microservice**
- The permit is issued
-> **IssuePermit microservice**
-> **PDF microservice**
-> **Email microservice**

New requirement!

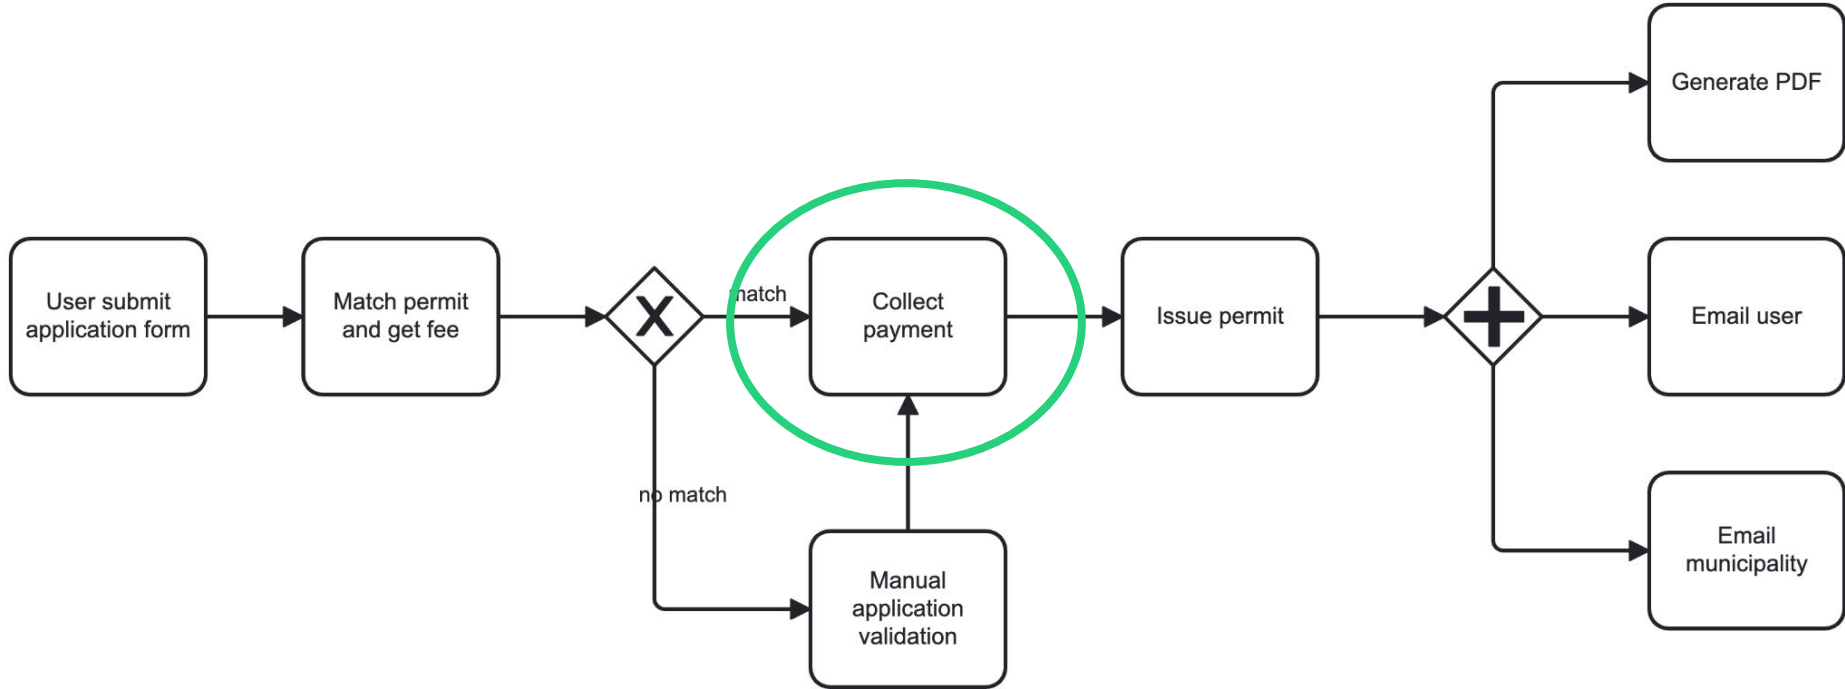

“A user tried to fill in the form, but it **didn't match** a permit!”

New requirement!

“If they **don't pay in X days**, the permit needs to be **canceled!**”

How might you solve this?

Introducing

*Business
Process Model
and Notation*

Maintained spec

ISO/IEC 19510 spec
maintained by OMG
(Object Management
Group)

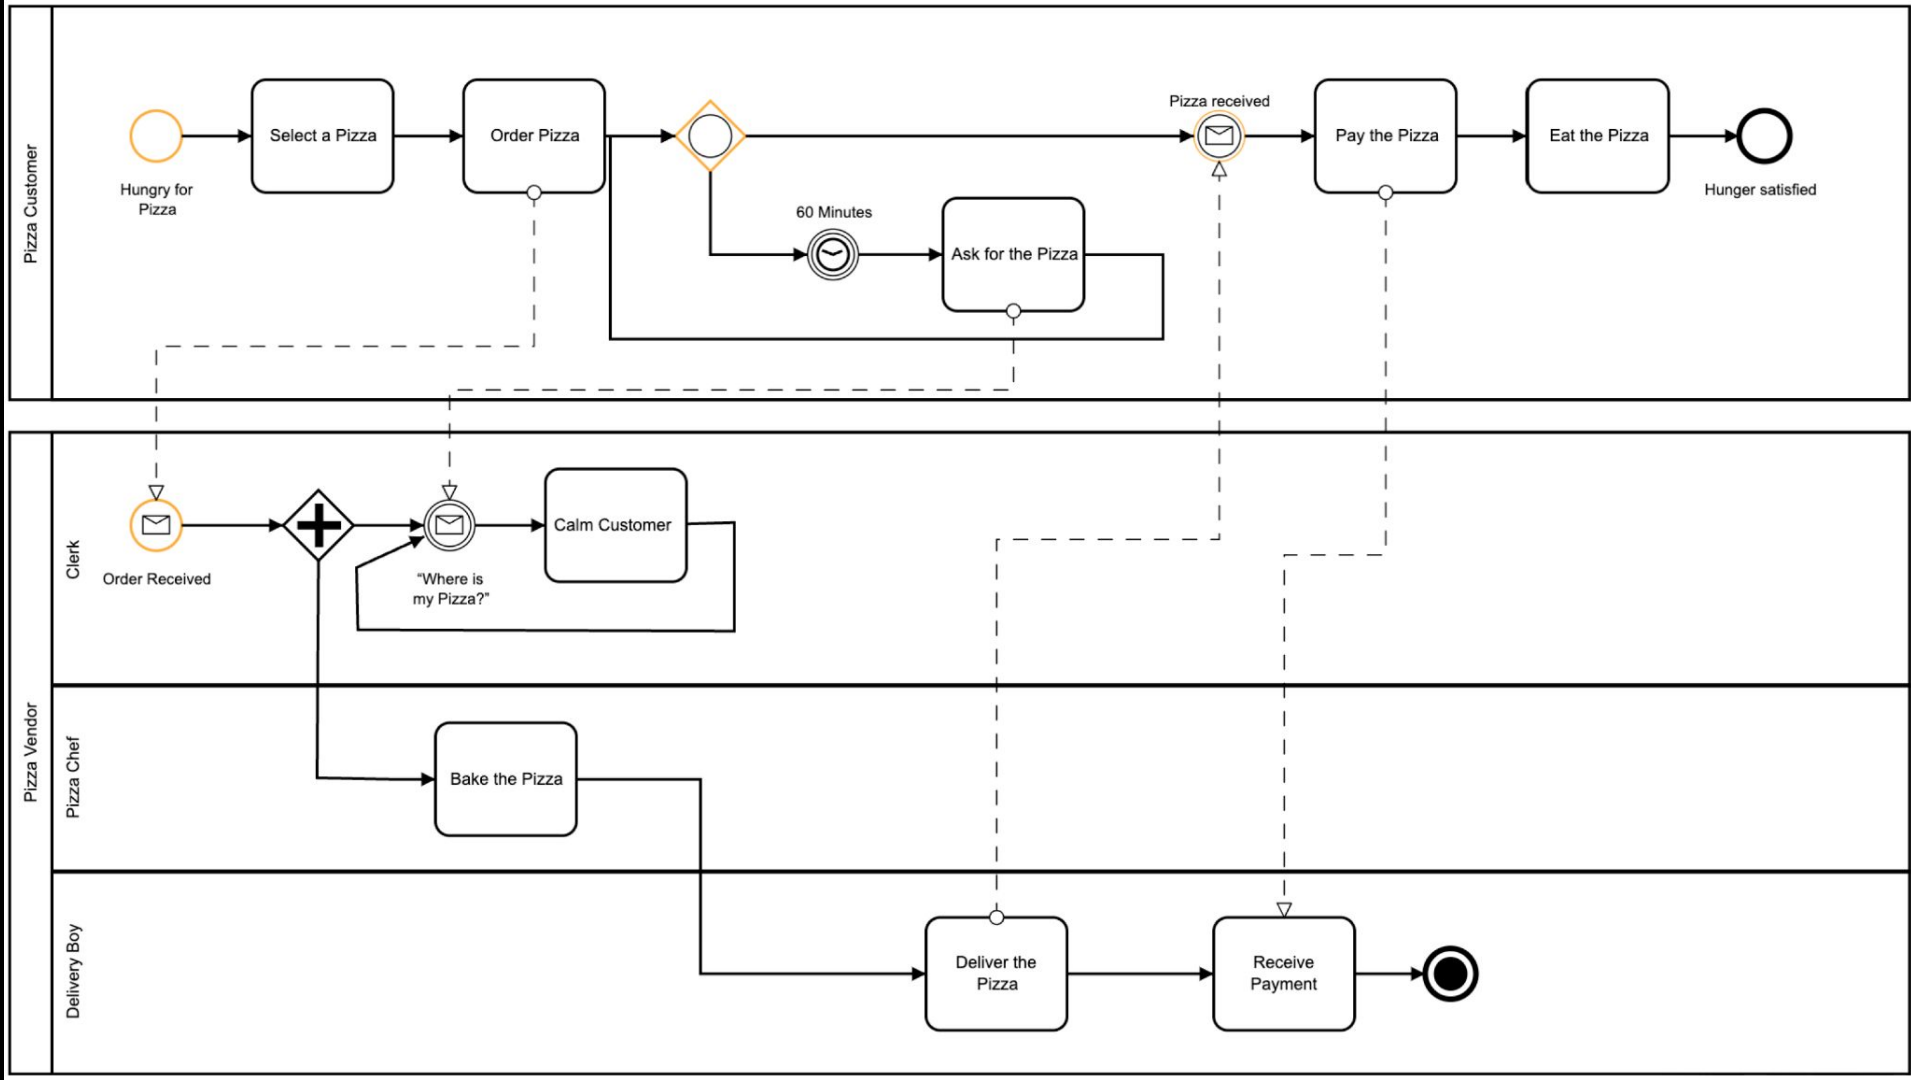

Visualization

Easily understand
complex processes; no
more spaghetti!

Bridge communication

Simplify discussions
with stakeholders;
unify design and
implementation

Remember this?

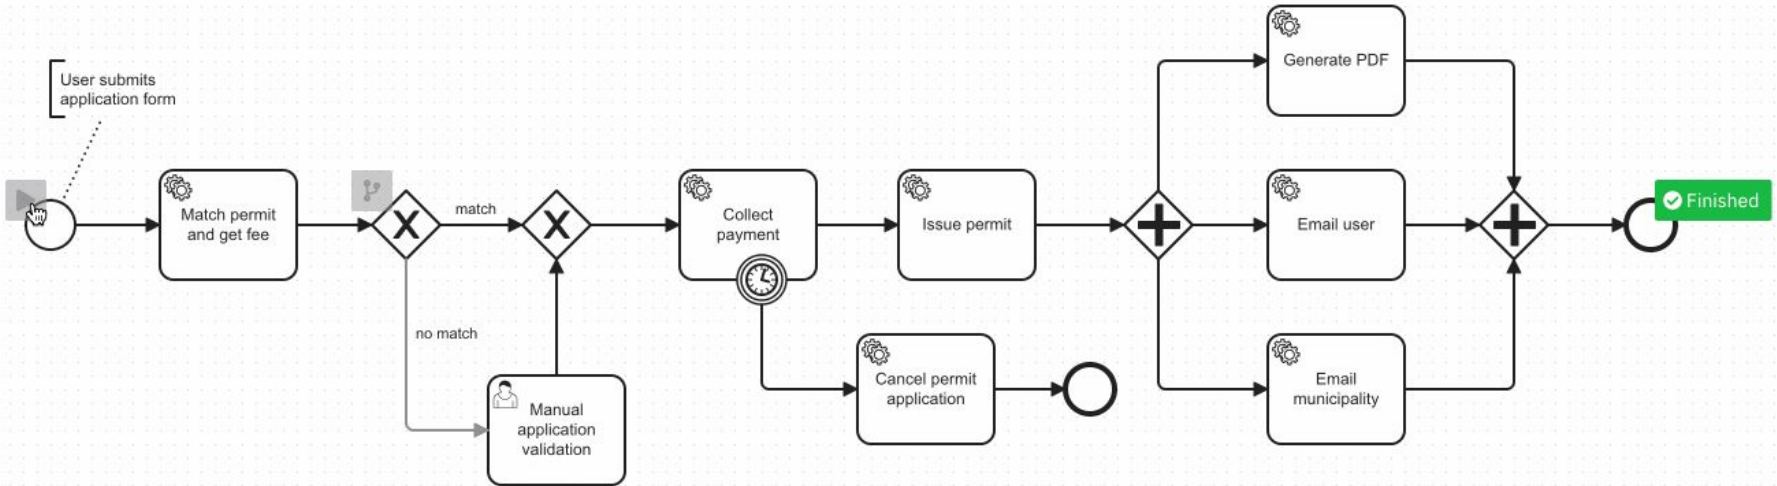

“If they **don't pay in X days**, the permit needs to be **cancel**ed!”

**... That's great, dude,
but that's just a diagram.**

... or is it?!

BPMN Engines

(Workflow Management Systems)

Many options to choose from

Camunda - The Universal Process Orchestrator

Orchestrate

Complex process flows across people, systems and devices.

Automate

Any process, anywhere.

Transform

Your organization toward a digital future.

Collaborate

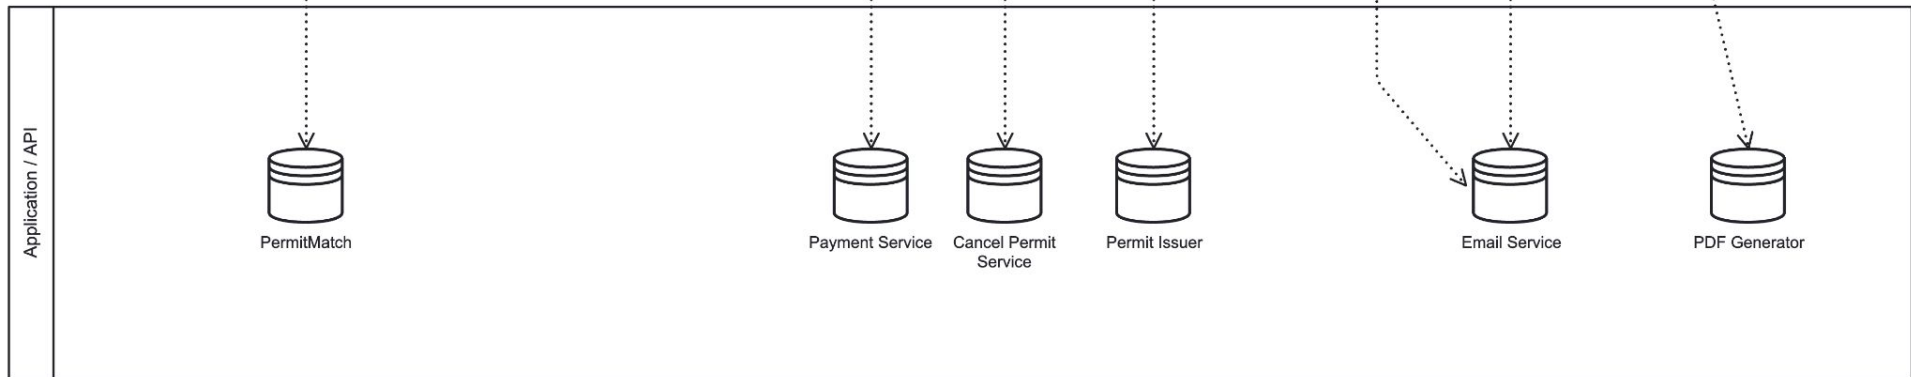

Flexibility

All Endpoints

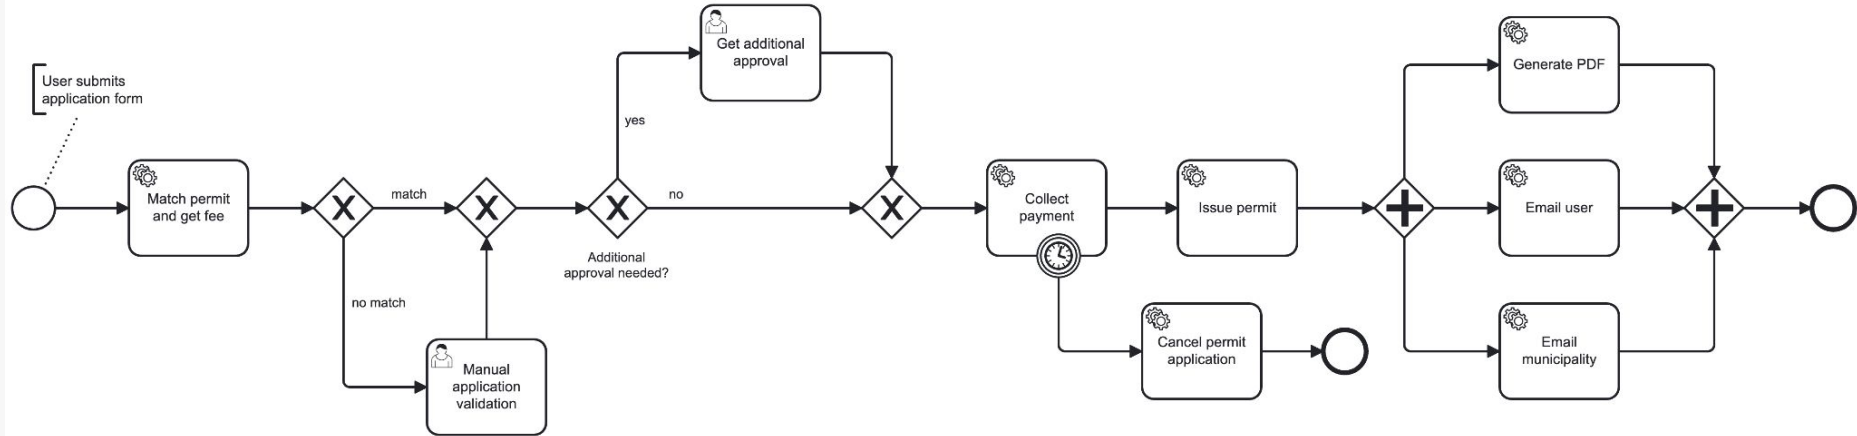

The state of a process is managed by the workflow engine, not the application.

The data is managed by the application, not the engine.

New requirement!

“For some permits, they need **additional approval** before collecting payment.”

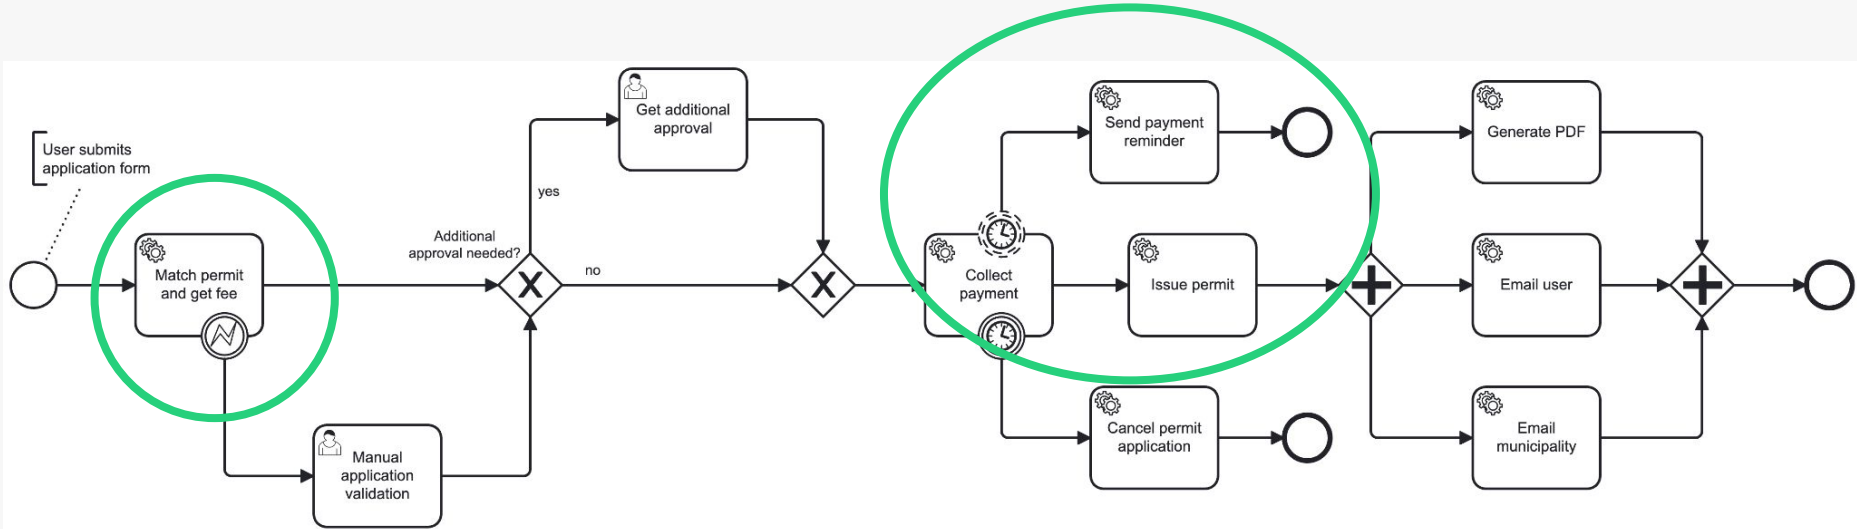

New requirement!

“Oh, and we should probably send a **payment reminder** before we cancel the permit.”

Errors and reminders

That was easy!

Let's review

1

BPMN

Open spec that defines processes in an organized, understandable way.

2

BPMN Engines

Execute the process as drawn, connecting tasks to external services. State of each process is controlled by the engine, not the application.

3

Simplified management

Easily add additional tasks without changing existing application; engines provide management tools to monitor performance etc.
