### WHY WE HAVE A Problem?

### History

Design began in late 2007.

Key players:

- Robert Griesemer, Rob Pike, Ken Thompson
- Later: Ian Lance Taylor, Russ Cox

# WHY WE HAVE A PROBLEM?

A personal history of dependencies at Google Plan 9 demo: a story Early Google: one Makefile 2003: Makefile generated from per-directory BUILD files • explicit dependencies

40% smaller binaries

Dependencies still not checkable!

### **SIMPLE SOLUTION!**

<sup>©</sup>Dependencies are sources <sup>®</sup>Remote import is a VCS path <sup>©</sup>Dump everything together into one source tree (GOPATH) Compile Profit

### BUT... HOW DO I...

<sup>©</sup>Know which dependencies do I use?

<sup>©</sup>Know which dependencies did you use?

<sup>©</sup>Know which dependencies should I use?

Know is it our code that I am editing right now?
WTF is going on?!

### YEAH...

To date, we've resorted to an email semaphore whenever someone fixes a bug a package, imploring everyone else to run go get -u. You can probably imagine how successful this is, and how much time is being spent chasing bugs that were already fixed.

Dave Cheney

### **DUPLICATE YOUR DEPENDENCIES**

### **Check your dependencies to your own VCS**.

Brad Firzpatrick

### **BUILD YOUR OWN DEPENDENCY MANAGER**

It's not the role of the tooling provided by the language to dictate how you manage your code in the production sense.

Andrew Gerrand

### WE EXPECT YOU TO ALREADY HAVE A HOMEGROWN Dependency manager

If you need to build any tooling around what Go uses (Git, Mercurial, Bazaar), you already understand those tools, so it should be straightforward to integrate with whatever system you have.

Andrew Gerrand

### **DON'T TRUST WHAT WE'VE BUILT**

Go-get is nice for playing around, but if you do something serious, like deploying to production, your deploy script now involves fetching some random dude's stuff on GitHub.

**Brad Firzpatrick** 

# NEXT THING YOU KNOW...

# THERE ARE 19 DEPENDENCY MANAGERS

SPACE RANGER LIGHTYE.

### **QUIZ TIME!**

# GOPATH, THE PROUD SON OF THE MONOREPO

:00

 $||b|^2$ 

### TWO HUGE Problems with Gopath

It only allows a single version of any given package to exist at once (per GOPATH)

We cannot programmatically differentiate between code the user is working on and code they merely depend on

### **VENDORING – THE WORST KIND OF FORKING**

Copy all of the files at some version from one version control repository and paste them into a different version control repository

### WHAT'S WRONG WITH IT (WELL, WHAT'S NOT)

History, branch, and tag information is lost <sup>(\*)</sup> Pulling updates is impossible <sup>©</sup>It invites modification, divergence, and bad fork **Ut wastes space** Good luck finding which version of the code you forked

# WAITA MINUTE...

# WE USE SUBMODULES!

### **STILL WRONG!**

<sup>©</sup>You still have no idea what version are you using <sup>(\*)</sup>You have to connect each dependency as a submodule manually <sup>(\*)</sup>Switching branches and forks LOL <sup>©</sup>Working on modules with other teams ROFL

### THE GO DEP Experiment

### So you want to write a package manager

You woke up this morning, rolled out of bed, and thought, "Y'know what? I don't have enough misery and suffering in my life. I know what to do—I'll write a language package manager!"

### Package management is awful, you should quit right now

Package management is a nasty domain. Really nasty. On the surface, it *seems* like a purely technical problem, amenable to purely technical solutions. And so, quite reasonably, people approach it that way. Over time, these folks move inexorably towards the conclusion that:

1. software is terrible

...

- 2. people are terrible
- 3. there are too many different scenarios
- 4. nothing will really work for sure
- 5. it's provable that nothing will really work for sure
- 6. our lives are meaningless perturbations in a swirling vortex of chaos and entropy

### PROPER DEPENDENCY MANAGEMENT?

 Working in project directories
 Local cache for dependencies
 Version declarations
 Conflict resolution

### CONFLICT ON THE CONFLICT RESOLUTION

SAT/SMT vs MVS/SIV

### ENTER GO Modules

# **ENTER GO MODULES**

### BACKWARDS Compatibility and Migration

go mod init
go.mod file is created
The rest is the same:
imports in code just work

### THAT'S SOME SERIOUS MAGIC...

### **GO MODULES CONVERT EVERYTHING (ALMOST?)**

var Converters = map[string]func(string, []byte) (\*modfile.File, error){ "GLOCKFILE": ParseGL0CKFILE, "Godeps/Godeps.json": ParseGodepsJSON, "Gopkg.lock": ParseGopkgLock, "dependencies.tsv": ParseDependenciesTSV, "glide.lock": ParseGlideLock, "vendor.conf": ParseVendorConf, "vendor.yml": ParseVendorYML, "vendor/manifest": ParseVendorManifest, "vendor/vendor.json": ParseVendorJSON,

### WHAT HAPPENS TO GO.MOD WHEN You add import (And run go get/go build)

## SELECTING A VERSIONP

Latest compatible version tag

mulckmethe com

### **COMPATIBLE?!**

<sup>©</sup>Let's assume SemVer works (LOL) <sup>©</sup>The latest version of v1.x.x is compatible with v1.0.0 and up <sup>(\*)</sup> Premise: import path string should always be backwards compatible

## WHAT ABOUT Version 2?!

use the same import path

<sup>©</sup>Add /v2/ to the module path

Use /v2/ in the import path

import "github.com/my/module/v2/mypkg"

## WHAT IF IT DOESN'T HAVE ANY SEMVER TAGS?!

#### Pseudo version

#### v0.0.0-yyyymmddhhmmss-abcdefabcdef

## WHAT IF (WHEN) I WANT TO BAN A VERSION?!

% You can specify "version X or later": >= x.y.z

You can use exclude or replace for better control

#### HOUSTON... I THINK I LOST MY MODULE?

FROM VENDORING TO HIERARCHY OF MODULE REPOSITORIES

ACED

Time Its FALLY Personial MAI SPEEK

#### **MODULES SHOUD BE IMMUTABLE**

The <module>@v<version> construct should be immutable

That means that

github.com/myuser/myrepo/@v/v1.0.0

Should forever be the same...

#### **BUT ARE THEY REALLY?**

#### **"**Friends don't let friends do git push -f"

Aaron Schlesinger

#### **USING THE GOPROXY VARIABLE**

## export GOPROXY=https://myawesomeproxy.com go get github.com/myuser/myrepo

#### **KEEPING MODULES**

#### Local cache (\$GOPATH/pkg/mod)

Immediate access, not shared, can be wiped...

Organizational cache (private proxy)

Fast access, requires infra, shared across devs

Public cache (public proxy)

Highly available, CDN, no infra, free

JFrog GoCenter

### **IMMUTABLE AND REPEATABLE BUILDS**

#### Immutable dependencies

The best way to guarantee issues is force push

#### Lost Dependencies

Who doesn't remember left-pad with Node.js?

#### Internet Issues

Even build when GitHub is down!?

#### AND ALSO FASTER BUILDS...
